LETTERS TO THE EDITOR

Prevalence of HPV cervical infections among imprisoned women in Barcelona, Spain

EDITOR,—The penitentiary centres in Spain harbour inmates in whom the combination of HIV infection, history of injecting drug use, and prostitution is common.1 Extensive protocols to detect sexually transmitted diseases and tuberculosis are implemented in these centres; however, human papillomavirus (HPV) infections and related lesions are not routinely searched for. Although Spain is characterised by a very low incidence of cervical cancer,2 a high rate of cervical cancer has been reported recently among the AIDS female population in Catalonia.3 We carried out a study aiming to characterise HPV cervical infection and related cervical lesions among women with many potential risk factors for cervical neoplasia. The study was done in the only institution in Barcelona where women are imprisoned. The population consisted of 157 women attending the medical office of the prison between February and December 1996 and represented 90% of all women staying in prison for more than 3 days. Women who agreed to participate underwent a gynaecological examination, collection of cervical cells, a structured interview by a trained nurse, determination of HIV, hepatitis B and C serostatus, and detection of HPV DNA in the cervical cells by means of PCR. L1 consensus primers MY09/MY11 were used with modifications as described by Hildesheim et al.1

HPV DNA was detected in 48% of the women. The prevalence of cervical abnormalities was 29.9%; 19 women had a atypical squamous cell of undetermined significance (ASCUS) and 28 women were diagnosed with squamous intraepithelial lesion (SIL), five of whom had a high grade lesion. All women with a SIL and 42% of those with an ASCUS were HPV positive. Prostitution was reported by 38.2% and injecting drug use by 64.3% women. HPV infection was detected in 56.1%. HPV detection remained significantly associated with SIL in women with a very high rate of HPV infection linked to injecting drug use and with a rate of pre-neoplastic cervical lesions about seven times higher than that observed in the general population.

While in prison these women were appropriately treated for HIV infection and for SIL. When out of prison or on bail, a gynaecological screening every 6–12 months should be organised and recommended.

Financial support: This work has been partially supported by the Spanish Ministry of Health, FIS No 98/056.

We thank Mrs Anna Coma for her assistance with data managing and analysis.

Rising HIV prevalence in STD clinic attenders at Chandigarh (north India)—a relatively low prevalence area

EDITOR,—The patients attending the STD clinics are at risk of having concurrent HIV infection. The trends of HIV infection in these patients may reflect the trends of HIV epidemic in the community. We have analysed the HIV status of 981 patients (824 males, 157 females) who attended our STD clinic from January 1993 to July 1999 (about 6½ years). The screening for HIV was done by ELISA. Those who were found positive were tested by repeat ELISA utilising another blood sample and considered HIV seropositive only, if both samples were found positive. The STDs were diagnosed by appropriate laboratory tests. The majority of the attenders had STDS; however, a small but significant proportion of patients had psychosocial disorders and other non-sexually transmitted genital diseases. Four per cent of the 981 patients—that is, 40 patients (26 males, 14 females) were found to be seropositive for HIV. The annual prevalence showed a rising trend (1993, 0.56%; 1994, 4.4%; 1995, 2.4%; 1996, 4%; 1997, 4.4%; 1998, 5.7%; and January to July 1999, 8.7%). The prevalence of HIV seropositivity in different STDS is shown in table 1. Large proportions of seropositive patients were truckers (15/40, 37.5%) and housewives (12/40, 30%). Among 12 housewives, four were wives of truckers. All of the 26 seropositive male patients confessed to at least one sexual contact with commercial sex workers (CSWs). Twenty eight (70%) seropositive patients had one STD, while the remaining 12 (30%) patients had more than one STD; 18 (45%) seropositive patients had STDs with either atypical morphologies or unusual severity, the remaining 22 (55%) presented with usual morphologies.

India is a country with a wide variation in geographical, cultural, and behavioural patterns. This is also reflected in the trends of current HIV epidemic in the various regions of the country. We believe that no other country has such a high intranation variation in HIV epidemic status. Our data on HIV prevalence with STD clinics of different regions of the country highlights this difference. The high HIV prevalence zones of the country include western and northern states, where HIV prevalence among STD clinic attenders varies from 15% to 33%.

On the other hand, in eastern and southern zones, it is still low and varies from 0.2 to 4%,** with a very high, the HIV epidemic in this region is now progressing at an alarming rate. In our study, the prevalence in our STD clinic increased from 0.56% in 1993 to 8.7% in 1999 (to July). This indicates that northern India is entering from a low level epidemic (HIV prevalence less than 5% in STD patients) to a concentrated epidemic.** This calls for an immediate vigorous intervention programme to be introduced in this region.

HIV seropositivity in women with syphilis in Delhi, India

EDITOR,—There has been a progressive rise in the prevalence of human immunodeficiency virus (HIV) infection in India, which currently has the largest number of HIV infected people in the world. The spread of HIV is predominantly by heterosexual transmission in India.** Sexually transmitted disease (STD), particularly genital ulcer disease (herpes, syphilis, and chancroid), has an important role in the transmission of HIV, and the two have been observed to be interrelated.*** We conducted a pilot study to assess the relation between syphilis and HIV infection among non-pregnant women attending gynecology and STD clinics of our hospital.

From June 1998 to July 1999, sera from 281 non-pregnant women were tested for HIV using a single ELISA assay. Samples that were reactive in all the three tests were considered HIV antibody positive. A sample that was non-reactive on the first test was considered HIV negative, as was a sample that was reactive in the first and non-reactive in the next test.

Of 281 sera tested, 48 (17%) were seropositive for syphilis. HIV antibody was detected in sera of six (12.5%) patients who were seropositive for syphilis (table 1). None of the 255 patients with negative syphilis serology tested

*The discrepancy in total is due to the presence of more than one STD in some patients.
positive for HIV antibody. This was highly significant (p<0.001, Fisher's exact test). Presence of HIV antibody was associated with genital ulcer in 23.5% women, followed by genital growth and vaginal discharge in 16.6% and 11.1% respectively.

There is a higher prevalence of STD and HIV infection among men compared with women. HIV seropositivity has been associated with a reactive serological test for syphilis among males. This could be probably due to higher percentage of male attendance in STD clinics.¹ We therefore undertook this study to evaluate if some association exists between syphilis and HIV among non-pregnant women attending the gynaecology clinic, as well as the STD clinic. Untreated STDs, especially those with ulcerative disease, can enhance both susceptibility of a person to HIV infection as well as infectivity of HIV positive individual. Breach in the epithelial surface of a genital ulcer may be an important factor in the transmissibility of HIV. This is evident from our results where incidence of positive serology for HIV was highest among women with genital ulcer (23.5%). Our study demonstrates a significant association between positive serology for syphilis and presence of HIV infection. We feel that the diagnosis of syphilis in non-pregnant women may act as a marker to detect the presence of HIV infection.

*Intratineural death, still birth, repeated abortions.

In a 41 year old white homosexual man presented in late July 1999 with a 5 day history of exertional dyspnoea, non-productive cough, fever with sweats, and anorexia. An empirical course of broad spectrum antibiotics did not improve his symptoms and Sa02 remained <98% on air at rest. The chest radiograph showed non-specific abnormalities. He had been found to be HIV-1 antibody positive in August 1991; cutaneous Kaposi's sarcoma defined AIDS in June 1992. In May 1995 biopsy of the tonsil revealed Cytomegalovirus (CMV) oesophagitis and colitis were treated with intravenous ganciclovir for 2 weeks; no maintenance therapy was given. At this time the CD4 count was 130 cells ×10⁹/l. In October 1996 the patient had Pneumocystis carinii pneumonia. He had a complex antiretroviral history, having taken combinations of reverse transcriptase inhibitors and protease inhibitors. He had discontinued all antiretroviral therapy 6 weeks after the patient had failed to maintain CD4 counts and HIV viral load had risen: co-trimoxazole primary Pneumocystis carinii pneumonia prophylaxis had been continued. In late June 1999 HIV viral load had risen to 4.5 ×10⁶ copies/ml and CD4 count had fallen to 70 cells ×10⁹/l. Two weeks before the onset of respiratory symptoms the patient had recommenced antiretroviral therapy with d4T, 3TC, and amiprenvir/ saquinavir. Four weeks after starting antiretroviral therapy viral load had fallen to 1500 copies/ml and CD4 had risen to 170 cells ×10⁹/l. A computed tomography (CT) scan of the thorax 4 weeks after the onset of respiratory symptoms and 6 weeks after starting antiretroviral therapy showed focal areas of ground glass shadowing, largely in the left upper lobe but also involving other lobes; in addition, chronic changes resulting from the previous episode of pneumonia were noted, including multifocal fibrotic change with thickened interlobular septae, cystic air spaces, and minor bronchiectasis involving all lobes. Repeat viral load at this time >200 copies/ml and CD4 = 160 cells ×10⁹/l. At bronchoscopy, performed after 8 weeks of antiretroviral therapy, the endobronchial appearances were normal. Bronchosalveolar lavage (BAL) was performed from the left upper lobe. Analysis of BAL fluid revealed a lymphocytic reaction; many cells had intranuclear/cytoplasmic inclusions typical of CMV infection. In situ hybridisation for CMV was positive in mononuclear cells and culture for bacteria, mycobacteria, P carinii and other fungi were negative. Intravenous ganciclovir 10 mg/kg per day was given for 21 days, in addition, antiretroviral therapy and co-trimoxazole were continued. With this treatment there was a rapid defervescence of fever, a reduction in exertional dyspnoea and improvement in Sa02, to ≥98% on air. Repeat CT of the thorax after 3 weeks of intravenous ganciclovir showed an improvement in ground glass shadowing and persistence of the chronic changes. The patient was subsequently maintained on oral ganciclovir.

The diagnosis of CMV pneumonitis was made by identifying CMV as the sole pathogen in BAL fluid and the improvement in symptoms, Sa02, and CT appearances with ganciclovir as monotherapy. This diagnosis was made in the context of a rapidly falling viral load and an increase in CD4 count indicating partial immune reconstitution.

Partial restoration of cell mediated immunity induced by antiretroviral therapy, as shown by recovery of part of CD4 T cell reactivity to memory antigens, may cause development of sufficient inflammatory responses to produce symptoms and signs in patients latently infected with opportunistic infections. Reactivation mycobacterial lymphadenitis, cryptococcal meningitis, and CMV retinitis have been described. The current design of therapy here suggests CMV pneumonitis should be added to the list of immune reconstitution phenomena.

BOOK REVIEWS

A book with a title such as this one makes it difficult for the author to decide what to exclude. This book certainly fulfils its major objective of providing an easy reference manual for the diagnosis and management of common gynaecological conditions. It deals with almost all the gynaecological conditions that could be encountered in the community and the common gynaecological problems in hospital medicine. Overall, the topics covered are well presented with special points highlighted.
The use of pictures relating to almost all the conditions dealt with by the book breaks up what would otherwise be a book of lists. The use of two different views of the same woman exercising on a treadmill certainly made me smile. The first picture tells us she is an intensively training sportswoman who may develop amenorrhoea and osteoporosis with stress fractures while the second picture, on a page dealing with advice to women who do not want HRT, reveals she is a grand- mother taking regular exercise.

From a genitourinary medicine trainee point of view, I would have liked to see a more comprehensive chapter on pelvic infections and sexually transmitted diseases (this is the second smallest chapter in the book), and would have preferred this chapter to follow the one on vaginal and vulval problems. I am, however, glad to see that the role of the genitourinary clinic in the management of pelvic infections is emphasised.

These two books provide histories of STDs and HIV in nine sub-Saharan African countries and another 11 countries in the Asia-Pacific region. The contributors are mostly historians or social scientists and the historical accounts take the reader up to 1995. Each volume is divided up into well referenced scholarly monographs on individual countries and individual chapters will be of considerable interest to anyone with an interest in sexual health in the countries studied. The number of readers of this journal who will want to read both books throughout is likely to be much less, given that these books are fairly specialist medical historical studies written mainly by historians for historians. The decision of the editors to treat each country separately has led inevitably to much repetition of certain themes. Many chapters rehearse the familiar story of how governments have responded to public pressure to regulate prostitution and the difficulty of demonstrating whether such efforts have had any real impact on STD transmission. The most interesting example in this context is the account of the attempts to eradicate prostitution and STDs in China, a subject which has been particularly difficult to separate from the facts of the propaganda. Not only were STDs allegedly expunged from the population but they were deleted from medical textbooks too! Another theme to which contributors constantly return is the problem of differentiating non-venereal from venereal treponematosis. We are constantly reminded that syphilis reporting may be distorted by this issue but other pertinent issues such the unitarian theory of treponematosis, the lack of specificity of older serological test methods, the impossibility of determining the mode of transmission from serological results or, in many instances, from observed clinical manifestations, receive rather patchy and inconsistent coverage. A third recurring theme is the unreliability of passive reporting systems. While this is often acknowledged, contributors still feel obliged to cite whatever data they can unearth and to discuss observed trends that are unlikely to bear much relation to any true epidemiological situation.

What is there in these books for the clinician or epidemiologist with an interest in STDs? There is no shortage of entertaining anecdotes such as the expatriate doctor in Uganda who had himself publicly injected with mercury to demonstrate his faith in this treatment. The account of regular penicillin injections for prostitutes in Indonesia will interest those who are following studies of targeted periodic presumptive treatment in Africa such as the Lesedi Project. Having worked in Papua New Guinea, I was interested to see that written about spectacular epidemic of donovonosis that affected the Marind-anime tribe in the 1920s. I felt that the account given failed to bring alive the unique nature of this epidemic and the campaign to control it. The main problem for more clinically oriented readers is the wealth of innovative approaches to STD and HIV control that have been explored in these countries since 1995 and which are too recent for inclusion in these volumes. The accounts of HIV go little further than the difficulties experienced in galvanising governments out of denial and into action. For detailed accounts of the Zanzania and Rakatai trials and their impact on policy and for the discussion of more topical controversies such as the possible role of polio vaccine development in the Congo in triggering the HIV pandemic we will have to look to future historians.

JOHN RICHERNS
Department of Sexually Transmitted Diseases, Mortimer Market Centre, Mortimer Market, off Copper Street, London WC1E 6AU

This book is a terrific read and should be read cover to cover by all practising genito-urinary medicine physicians and trainees. Generally the quality of the writing is excellent. Genitourinary medicine is a rapidly advancing field so the book now before it becomes out of date. Already the incubation period of the text shows in places. Some statistics relate to 1992 while 1997 figures are available. Some statements are also slightly out of date.

In a book of this size the referencing presents a challenge. If one references every statement (and considers all the conflicting evidence) the handbook turns into a weighty and unmanageable tome. Mostly, the authors have managed a sensible compromise. Statements that are uncontroversial or old hat are not referenced. Occasionally more controversial statements remain unreferenced. This may present a problem for the trainee. There are also some surprising omissions. I could find no description of desquamative vaginitis or focal vulvitis. However, I believe that this handbook could serve as an excellent basis for discussions between trainer and trainee and stimulate further reading around these topics.

Get this book. You will enjoy it. A number of chapters are absolute gems.

Quality of life and use of health care among people with genital herpes in France.
R TABOLEUT, B HALLOU, JE MALEN. Acta Derm Venereol 1999;79:380–4

The differential impact of training stress and final examination stress on herpes-virus latency at the United States Military Academy at West Point.

College students’ attitudes regarding vaccination to prevent genital herpes.
SL ROSENTHAL, LM LEWIS, PA SUCOF et al. Sex Transm Dis 1999;26:438–43

Ecthyma secondary to herpes simplex virus infection.
A KINTAJASDI, N TAUSK, HC NOUSARI. Clin Infect Dis 1999;29:454

Acquired lymphedema of the hand due to herpes simplex virus type 2.
DF BUTLER, FJ AMOLOU, BC BATEZ, CL STETSON. Arch Dermatol 1999;135:1125

Whole cell lysate enzyme immunoassays vs recombinant glycoprotein G2-based immunoassays for HSV-2 seroprevalence studies.

A double-blind, randomized study assessing the equivalence of valacyclovir 1000 mg once daily versus 500 mg twice daily in the episodic treatment of recurrent genital herpes.

Foscarinet treatment of genital infection due to acyclovir-resistant herpes simplex virus 2 in a pregnant patient with AIDS: case report.
A ALVAREZMCLEDO, J HAYLUI, KE DRIN. Clin Infect Dis 1999;29:937

The comparative effects of famciclovir and valacyclovir on herpes simplex virus type 1 infection, latency and reactivation in mice.
RA LEIBLAC, L PESNICAK, M GODLESKI, SE STRAU. J Infect Dis 1999;180:594–9
Antiviral properties of isoborneol, a potent inhibitor of herpes simplex virus type 1.

Antierherpetic activity and mode of action of natural carrageenans of diverse structural types.

Civamide (cis-capsaicin) treatment of primary or recurrent experimental genital herpes.

γΥ T cell response induced by vaginal herpes simplex 2 infection.

Humoral response to herpes simplex virus is complement-dependent.

LAT expression during an acute HSV infection in the mouse.

Inhibition of dendritic cell maturation by herpes simplex virus.

Human papillomavirus infection

Assessing gains in diagnostic utility when human papillomavirus testing is used as an adjunct to Papanicolaou smear in the triage of women with cervical cytologic abnormalities.

HPV testing in primary screening of older women.

Do HPV-negative cervical carcinomas exist revisited.
Cs Herrington. J Pathol 1999;189:1–3

Human papillomavirus is a necessary cause of invasive cervical cancer worldwide.
Jmm Walboomers, Mv Jacobs, Mm Manos et al. J Pathol 1999;189:12–9

Has the use of Pap smears reduced the risk of invasive cervical cancer in Guadalajara, Mexico?

Familial risks in cervical cancer: is there a hereditary component?
Ke Haminkel, Ch Dong, P Vaittinen. Int J Cancer 1999;82:775–81

Human papillomavirus infection, cervical dysplasia and invasive cervical cancer in Honduras: a case-control study.

Human papillomavirus-associated penile squamous cell carcinoma in HIV-positive patients.

Enhancement of the innate and cellular immune response in patients with genital warts treated with topical imiquimod cream 5%.

Intravascular or topical cidofovir for the treatment of recurrent genital warts infected with HPV1-infected patients.

Histologic and immunologic associations of an HPV16 variant in low-grade smears.
Jj Etherington, Jr Ellis, Dm Luesley et al. Br J Obstet Gynaecol 1999;106:1102

Seroprevalence of human papillomavirus type 16 in pregnant women.

Serum antibodies to human papillomavirus 16 proteins in women from Brazil with invasive cervical carcinoma.

Serological evidence for protection by human papillomavirus type 6 infection against HPV type 16 cervical carcinogenesis.

The integration of HPV-18 DNA in cervical carcinoma.

High prevalence of human papillomavirus type 58 in Chinese women with cervical cancer and precancerous lesions.

Use of a hybrid capture assay of self-collected vaginal swabs in rural Uganda for detection of human papillomavirus.

A quantitative polymerase chain reaction enzyme immunoassay for accurate measurements of human papillomavirus type 16 DNA levels in cervical scrapings.

Degenerate and nested PCR: a highly sensitive and specific method for detection of human papillomavirus infection in cutaneous warts.

Analysis by multiple PCR of the physical status of human papillomavirus type 16 DNA in cervical cancers.

HPV typing and HPV16 E6-sequence variations in synchronous lesions of cervical squamous-cell carcinoma from Swedish patients.
Xr Ju, Zm Guo, F Tianyun et al. Int J Cancer 1999;83:34–7

Human immunodeficiency virus infection in vitro activates naturally integrated human papillomavirus type 18 and induces synthesis of the L1 capsid protein.

Chimeric virus-like particles of the human papillomavirus type 16 as a prophylactic and therapeutic vaccine.

A recombinant human papillomavirus type 16 L1-vaccine virus murine challenge model demonstrates cell-mediated immunity against HPV virus-like particles.

Nasal immunization of mice with human papillomavirus type 16 virus-like particles or with the HPV-16 L1 gene elicits specific cytotoxic T-lymphocytes in vaginal draining lymph nodes.

Mucosal but not parenteral immunization with purified human papillomavirus type 16 virus-like particles induces neutralizing titers of antibodies throughout the estrous cycle of mice.

p53 codon 72 arg/pro polymorphism is not related to HPV type or lesion grade in low- and high-grade squamous intraepithelial lesions and invasive squamous carcinoma of the cervix.

A GIANNOUCHIS, DA GRAHAM, SA SOUTHERN, CS HERRINGTON. Int J Cancer 1999;83:66–9

E7-specific cytotoxic T cell tolerance in HPV-transgenic mice.

Establishment of the human papillomavirus type 16 life cycle in an immortalized human foreskin keratinocyte cell line.

ER FLORES, BL ALLENHOFFMANN, D LEE et al. Virology 1999;262:344–54

Papillomavirus E2 induces p53-independent apoptosis in HeLa cells.

C DEBRANTES, S GOYAT, S GARAY et al. Oncogene 1999;18:4538–45

Transcription-modulatory activities of differentially spliced cDNAs encoding the E2 protein of human papillomavirus type 16.

N ALLOUL, L SHERMAN. J Gen Virology 1999;80:2461–70

The human papillomavirus 18 oncoprotein physically associates with Tyk2 and impairs Jak-STAT activation by interferon-α.

Cervical cytology and colposcopy

Organised vs spontaneous pap-smear screening for cervical cancer: a case-control study.

P NIEMINEN, M KALLIO, A ANTITILA, M HAKAMA. Int J Cancer 1999;83:55–8

A ANTITILA, E POIKALA, B SODERMAN et al. Int J Cancer 1999;83:59–65

Beliefs about Papancicolaou smears and compliance with Papanicolaou smear follow-up in adolescents.

Follow up of women with borderline cervical smears as defined by national guidelines.

The clinical significance of the poor correlation of cervical dysplasia and cervical malignancy with referral cytologic results.

See-and-treat in the management of high-grade squamous intraepithelial lesions of the cervix: a resource utilization analysis.

Angiogenesis in cervical intraepithelial neoplasia and the risk of recurrence.

Hormone receptor status in cervical intraepithelial neoplasia: correlation with the stage of disease.

Atypical immature metaplastic-like proliferations of the cervix: diagnostic reproducibility and viral (HPV) correlates.

JF PARK, DR GENEST, DQ SUN, CF CRUM. Hum Pathol 1999;30:1161–5

Abnormal Fhit expression in malignant and premalignant lesions of the cervix.

Other sexually transmitted infections

Serologic evidence of human herpesvirus 8 transmission by homosexual but not heterosexual sex.

NA SMITH, CA SABIN R GOPAL et al. J Infect Dis 1999;180:600–6

Immune cells are required for cutaneous ulceration in a swine model of chancreoid.

LR SANMATEO, EL TOFFER, PE ORNDORFF, TH KAWULA. Infect Immun 1999;67:4963–73

Examination of early interactions between Haemophilus ducreyi and host cells by using cocultured HaCaT keratinocytes and foreskin fibroblasts.

FF ZARETZKY, TH KAWULA. Infect Immun 1999;67:5352–60

Public health and social aspects

STD testing policies and practices in US city and county jails.

MS PARECE, GA HERRERA, RF VOIGHT et al. Sex Transm Dis 1999;26:431–7

Sale of sex for drugs and drugs for sex: an economic context of sexual risk behavior for STDs.

J BASEMAN, M ROSS, M WILLIAMS. Sex Transm Dis 1999;26:444–9

Locus of control for general health and STD acquisition among adolescent girls.

IS ROSENTHAL, SS COHEN RP DENVILLE et al. Sex Transm Dis 1999;26:472–5

Factors influencing sexual partner referral for sexually transmitted diseases in Uganda.

F NUWABA, F KAMBUUGI, PJS NSEBUUGA. Sex Transm Dis 1999;26:483–9

Providing low-cost sexually transmitted diseases services in two semi-urban health centers in Central African Republic: characteristics of patients and patterns of health care-seeking behavior.

KA PARKER, EH LOUMANS, RV HAWKINS et al. Sex Transm Dis 1999;26:508–16

C EBANZ, W LAPERTRY, AM KEMBALL et al. Sex Transm Dis 1999;26:537–42

Sexually transmitted diseases services in societies with limited resources.

A RONALD. Sex Transm Dis 1999;26:517–8

Condom use in young blacks and hispanics in public STD clinics.

AE MAXWELL, R BASTANI, US WARD. Sex Transm Dis 1999;26:463–71

Sexually transmitted diseases and condom use among female freelance and brothel-based sex workers in Singapore.

ML WONG, KEW CHAI, WL CHUA, S WEE. Sex Transm Dis 1999;26:593–600

Predictors of condom use among patients with sexually transmitted diseases in Uganda.

F NUWABA, F FAEXILD, B HOFER. Sex Transm Dis 1999;26:491–5

Practice patterns for the elicitation of sexual history, education and counseling among providers of STD services: results from the gonorrea Community Action Project (GCAP).

SS BULL, C BIEUTEMEER, JD FORTENBERRY et al. Sex Transm Dis 1999;26:584–9

Microbiology and immunology

Roles of glycoproteins and oligosaccharides found in human vaginal fluid in bacterial adherence.

Identification of and hydrogen peroxide production by fecal and vaginal lactobacilli isolated form Japanese women and newborn infants.

Relationship between Ureaplasma urealyticum vaginal colonization and polymorphism in the interleukin-1 receptor antagonist gene.

Dermatology

Miscellaneous

Professional relationships in sexually transmitted diseases research—Thomas Pauran Award Lecture. RB Jones. Sex Transm Dis 1999;26:552–5

Acid production by vaginal flora in vitro is consistent with the rate and extent of vaginal acidification. ER Boskey, KM Teich, KJ Whaley et al. Infect Immun 1999;67:5170–7

Mechanical failure of the latex condom in a cohort of women at high STD risk. M Macaluso, J Kelaghan, L Artz et al. Sex Transm Dis 1999;26:450–8

Acceptability of a bioadhesive nonoxynol-9 gel delivered by an applicator as a rectal microbicide. M Gross, CL Celum, SR Taber et al. Sex Transm Dis 1999;26:564–71

Prevalence of HPV cervical infections among imprisoned women in Barcelona, Spain

Silvia de Sanjosé, Francesc Xavier Bosch, Imma Valls, Paz Cañadas, Belen Lloveras, Xavier Castellsagué and Keerti V Shah
