LETTERS TO THE EDITOR

Prevalence of HPV cervical infections among imprisoned women in Barcelona, Spain

EDITOR,—The penitentiary centres in Spain harbour inmates in whom the combination of HIV infection, history of injecting drug use, and prostitution is common.1 Extensive protocols to detect sexually transmitted diseases and tuberculosis are implemented in these centres; however, human papillomavirus (HPV) infections and related lesions are not routinely searched for. Although Spain is characterised by a very low incidence of cervical cancer,2 a high rate of cervical cancer has been reported recently among the AIDS female population in Catalonia.3 We carried out a study aiming to characterise HPV cervical infection and related cervical lesions among women with many potential risk factors for cervical neoplasia. The study was done in the only institution in Barcelona where women are imprisoned. The population consisted of 157 women attending the medical office of the prison between February and December 1996 and represented 90% of all women staying in prison for more than 3 days. Women who agreed to participate underwent a gynaecological examination, collection of cervical cells, a structured interview by a trained nurse, determination of HIV, hepatitis B and C serostatus, and a cytological screening every 6–12 months should be organised and recommended. Financial support: This work has been partially supported by the Spanish Ministry of Health, FIS No 98/064.

We thank Mrs Anna Coma for her assistance with data managing and analysis.

Detection of penicillinase producing Neisseria gonorrhoeae strains in Cuba, 1995–8

EDITOR,—Since the 1940s, penicillin has been recommended for the treatment of gonorrhoea. In the 1950s the first strains of Neisseria gonorrhoeae with reduced susceptibility to this antibiotic, as a result of chromosomal mutations, were isolated, and in 1970 the first penicillinase producing Neisseria gonorrhoeae (PPNG) strains emerged in South East Asia and Africa, causing high level resistance to penicillin (MIC ≥1 mg/ml).1 In Cuba, the first reported PPNG strain was made in 1986 (C Almanza, personal communication). We report here on the proportion of PPNG strains received at the Neisseria Reference Laboratory, Tropical Medicine Institute “Pedro Kouri” (IPK), Cuba between January 1995 and December 1998.

In all, 110 strains of N gonorrhoeae isolated from 10 of the 14 Cuban provinces were examined for their lactamase activity by the chromogenic method (Nitrocefin, Oxoid). These strains were transported to the IPK using a novel transport and conservation medium for gonococci developed at this laboratory.2 N gonorrhoeae WHO E and WHO A were used as positive and negative control strains, respectively. All strains were identified as gonococci by standard procedures.3

Table 1 shows the distribution of Cuban PPNG and non-PPNG strains detected in our laboratory during 1995–8. The PPNG strains predominated totally (61/110, 55.5%). The percentage of PPNG strains was high in all years analysed.4 To our knowledge it is the first study developed in Cuba, analysing the β-lactamase activity of N gonorrhoeae isolated from different provinces with such a high percentage of PPNG strains was found. Previous studies developed in specific Cuban hospitals in Havana City have revealed a lower percentage of PPNG strains (M Berroa et al, 1988; C Almanza et al, 1988, personal communications).

Penicillin has been the drug of choice for treatment of gonococcal infections in Cuba since 1972. A The results of this study indicate that any policy to treat such infections should not include penicillin or other similar drugs. Other antimicrobials recommended by the World Health Organisation for treatment gonorrhoea—for example, spectinomycin, cephalosporins, quinolones, and azithromycin

Rising HIV prevalence in STD clinic attenders at Chandigarh (north India)—a relatively low prevalence area

EDITOR,—The patients attending the STD clinics are at risk of having concurrent HIV infection. The trends of HIV infection in these patients may reflect the trends of HIV epidemic in the community. We have analysed the HIV status of 981 (284 males, 157 females) who attended our STD clinic from January 1993 to July 1999 (about 6 1/2 years). The screening for HIV was done by ELISA. Those who were found positive were tested by repeat ELISA utilising another blood sample and considered HIV seropositive only, if both samples were found positive. The STDs were diagnosed by appropriate laboratory tests. The majority of the attenders had STDs; however, a small but significant proportion of patients had psychosocial disorders and other non-sexually transmitted genital diseases. Four per cent of the 981 patients—that is, 40 patients (26 males, 14 females) were found to be seropositive for HIV. The annual prevalence showed a rising trend (1993, 0.56%; 1994, 4.4%; 1995, 2.4%; 1996, 4%; 1997, 4.4%; 1998, 5.7%; and January to July 1999, 8.7%). The prevalence of HIV seropositivity in different STDs is shown in table 1. Large proportions of seropositive patients were truckers (15/40, 37.5%) and housewives (12/40, 30%). Among housewives, four were wives of truckers. All of the 26 seropositive male patients confessed to at least one sexual contact with commercial sex workers (CSWs). Twenty eight (70%) seropositive patients had one STD, while the remaining 12 (30%) patients had more than one STD; 18 (45%) seropositive patients had STDs with either atypical morphologies or unusual severity, the remaining 22 (55%) presented with usual morphologies.

India is a country with a wide variation in geographical, cultural, and behavioural patterns. This is also reflected in the trends of current HIV epidemic in the various regions of the country. We believe that no other country has such a high intranation variation in HIV epidemic status. Our data on HIV prevalence with STD clinics of different regions of the country highlights this difference. The high HIV prevalence zones of the country include western and southern zones, where HIV prevalence among STD clinic attenders varies from 15% to 33%. On the other hand, in eastern and northern zones, it is still low and varies from 0.2 to 4%. In our study we found that a high proportion of HIV positive patients were truckers, who generally acquired infection from CSWs from the highways to Bombay or Chennai, two metropolises of the western and southern zones respectively. These long distance truckers have a high risk sexual behaviour and contribute in the spread of HIV infection throughout the country in a short time. Even though the present figures for HIV seropositivity in STD clinic attenders are not very high, the HIV epidemic in this region is now progressing at an alarming rate. In our study, the prevalence in our STD clinic increased from 0.56% in 1993 to 8.7% in 1999 (to July). This indicates that northern India is entering from a low level epidemic (HIV prevalence less than 5% in STD patients) to a concentrated epidemic. This calls for an immediate vigorous intervention programme to be introduced in this region.

HIV seropositivity in women with syphilis in Delhi, India

EDITOR,—There has been a progressive rise in the prevalence of human immunodeficiency virus (HIV) infection in India, which currently has the largest number of HIV infected people in the world. The spread of HIV is predominantly by heterosexual transmission in India. Sexually transmitted disease (STD) particularly genital ulcer disease (herpes, syphilis, and chancroid), has an important role in the transmission of HIV, and the two have been observed to be interrelated. We conducted a pilot study to assess the relation between syphilis and HIV infection among non-pregnant women attending gynaecology and STD clinics of our hospital. From June 1998 to July 1999, sera from 281 non-pregnant women were tested for HIV antibody by VDRL (Serologist, India) and confirmed by TPHA (Immunotest, Omega Diagnostic Ltd, UK). Sera that tested positive for syphilis were tested for HIV without identifying the patient. Individual informed consent for HIV was not obtained as results were not aimed to be linked to the identity of those tested. Serum was tested first with one ELISA/rapid/simple (ERS) assay, utilising either of the different enzyme linked immunosorbent assay (ELISA) kits. United Medical Inc, USA, Recombigen HIV-1/HIV-2, EIA, Cambridge Biotech Galway, Ireland, and HIV spot Gene labs Diagnostic, Singapore). Any reactive sample was retested using a different assay. Samples that were reactive in all the three tests were considered HIV antibody positive. A sample that was non-reactive on the first test was considered HIV negative, as was a sample that was reactive in the first and non-reactive in the next test.

Of 281 sera tested, 48 (17%) were seropositive for syphilis. HIV antibody was detected in sera of six (12.5%) patients who were seropositive for syphilis (table 1). None of the patients with negative syphilis serology tested

* The discrepancy in total is due to the presence of more than one STD in some patients.

positive for HIV antibody. This was highly significant (p<0.001, Fisher's exact test).

Presence of HIV antibody was associated with genital ulcer in 23.5% women, followed by genital growth and vaginal discharge in 16.6% and 11.1% respectively.

There is a higher prevalence of STD and HIV infection among men compared with women. HIV seropositivity has been associated with a reactive serological test for syphilis among males. This could be probably due to higher percentage of male attendance in STD clinics. We therefore undertook this study to evaluate if some association exists between syphilis and HIV among non-pregnant women attending the gynaecology clinic, as well as the STD clinic. Untreated STDs, especially those with ulcerative diseases, can enhance both susceptibility of a person to HIV infection as well as infectivity of HIV positive individual. Breach in the epithelial surface of a genital ulcer may be an important factor in the transmissibility of HIV. This is evident from our results where incidence of positive serology for HIV was highest among women with genital ulcer (23.5%). Our study demonstrates a significant association between positive serology for syphilis and presence of HIV infection. We feel that the diagnosis of syphilis in non-pregnant women may act as a marker to detect the presence of HIV infection.

Immune reconstitution CMV pneumonitis

Eaton,--A 41 year old white homosexual man presented in late July 1999 with a 5 day history of exertional dyspnoea, non-productive cough, fever with sweats, and anorexia. An empirical course of broad spectrum antibiotics did not improve his symptoms and Sao2 remained >95% on air at rest. The chest radiograph showed non-specific abnormalities. He had been found to be HIV-1 antibody positive in August 1991; cutaneous Kaposi's sarcoma defined AIDS in June 1992. In May 1995 biopsy of buccal mucosa showed typical changes consistent with primary cytomegalovirus (CMV) oesophagitis and colitis were treated with intravenous ganciclovir for 2 weeks, then maintenance therapy was given. At this time the CD4 count was 130 cells x 10^9/l. In October 1996 non-caseating Mycobacterium avium intracellulare was identified. He had a complex antiretroviral history, having taken combinations of antiretroviral therapy and co-trimoxazole primary prophylaxis for P carinii pneumonia. He had a complex antiretroviral history, having taken combinations of reverse transcriptase inhibitors and protease inhibitors. He had discontinued all antiretroviral therapy 2 weeks after the last dose of ganciclovir. The patient had failed to maintain CD4 counts and HIV viral load had risen: co-trimoxazole primary Pneumocystis carinii pneumonia prophylaxis had been continued. In early June 1999 HIV viral load had risen to 6.0 x 10^6 copies/ml and CD4 count had fallen to 70 cells x 10^9/l. Two weeks before the onset of respiratory symptoms the patient had recommenced antiretroviral therapy with d4T, 3TC, and amenvpenicillin/saquinavir. Four weeks after starting antiretroviral therapy viral load had fallen to 1500 copies/ml and CD4 had risen to 170 cells x 10^9/l. A computed tomography (CT) scan of the thorax 4 weeks after the onset of respiratory symptoms and 6 weeks after starting antiretroviral therapy showed focal areas of ground glass shadowing, largely in the left upper lobe but also involving other lobes; in addition, chronic changes resulting from the previous episode of pneumonia were noted, including multifocal fibrotic change with thickened interlobular septae, cystic air spaces, and minor bronchiectasis involving all lobes. Repeat viral load at this time was 200 copies/ml and CD4 = 160 cells x 10^9/l. At bronchoscopy, performed after 8 weeks of antiretroviral therapy, the endobronchial appearances were normal. Bronchoalveolar lavage (BAL) was performed from the left upper lobe. Analysis of BAL fluid revealed a lymphocytic reaction; many cells had intranuclear/cytoplasmic inclusions typical of CMV infection. In situ hybridisation for CMV was positive in mononuclear and epithelial cells. Positive staining for CMV was also seen in ground glass shadowing and persistence of the chronic changes. The patient was subsequently main-
tained on oral ganciclovir.

The diagnosis of CMV pneumonitis was made by identifying CMV as the sole pathogen in BAL fluid and the improvement in symptoms, Sao2, and CT appearances with ganciclovir as monotherapy demonstrated that no other concurrent infection was present. This diagnosis was made in the context of a rapidly falling viral load and an increase in CD4 count indicating partial immune reconstitution.

Partial restoration of cell mediated immunity induced by antiretroviral therapy, as shown by recovery of part of CD4 T cell reactivity to memory antigens, may cause development of sufficient inflammatory responses to produce symptoms and signs in patients latently infected with opportunistic infections. Reactivation mycobacterial lymphadenitis, cryptococcal meningitis, and CMV retinitis have been described. The case described here suggests CMV pneumonitis should be added to the list of immune reconstitution phenomena.

BOOK REVIEWS

A book with a title such as this one makes it difficult for the author to decide what to exclude. This book certainly fulfils its major objective of providing an easy reference manual for the diagnosis and management of common gynaecological conditions. It deals with almost all the gynaecological problems that could be encountered in the community and the common gynaecological problems in hospital medicine. Overall, the topics covered are well presented with special points highlighted.
The use of pictures relating to almost all the conditions dealt with by the book breaks up what would otherwise be a book of lists. The use of two different views of the same woman exercising on a treadmill certainly made me smile. The first picture tells us she is an intensively training sportswoman who may develop amenorrhoea and osteoporosis with stress fractures while the second picture, on a page dealing with advice to women who do not want HRT, reveals she is a grandmother taking regular exercise.

From a genitourinary medicine trainee point of view, I would have liked to see a more comprehensive chapter on pelvic infections and sexually transmitted diseases (this is the second smallest chapter in the book) and would have preferred this chapter to follow the one on vaginal and vulval problems. I am, however, glad to see that the role of the genitourinary clinic in the management of pelvic infections is emphasised.

ADE APOOLA
Department of GU Medicine, Whittall Street Clinic, Whittall Street, Birmingham B4 6DH

These two books provide histories of STDs and HIV in nine sub-Saharan African countries and another 11 countries in the Asia-Pacific region. The contributors are mostly historians or social scientists and the historical accounts take the reader up to 1995. Each volume is divided up into well referenced scholarly monographs on individual countries and individual chapters will be of considerable interest to anyone with an interest in sexual health in the countries studied. The number of readers of this journal who will want to read both books throughout is likely to be much less, given that these books are fairly specialist medical historical studies written mainly by historians for historians. The decision of the editors to treat each country separately has led inevitably to much repetition of certain themes. Many chapters reappear the familiar story of how governments have responded to public pressure to regulate prostitution and the dificulties experienced in galvanising governments of denial and into action. For detailed accounts of the Tanzanian and Rakai trials and their impact on policy and for the discussion of more topical controversies such as the possible role of polio vaccine development in the Congo in triggering the HIV pandemic we will have to look to future historians.

JOHN RICHENS
Department of Sexually Transmitted Diseases, Mortimer Street Centre, Mortimer Market, off Copper Street, London WC1E 6DU

This book is a terrific read and should be read cover to cover by all practitioners genitourinary medicine physicians and trainees. Generally the quality of the writing is excellent. Genitourinary medicine is a rapidly advancing field so read the book now before it becomes out of date. Already the incubation period of the text shows in places. Some statistics relate to 1992 where 1997 figures are available. Some statements are also slightly out of date.

In a book of this size the referencing presents a challenge. If one references every statement (and considers all the conflicting evidence) the handbook turns into a weighty unmanageable tome. Mostly, the authors have managed a sensible compromise. Statements which are controversial or old hat are not referenced. Occasionally more controversial statements remain un referenced. This may present a problem for the trainee. There are also some surprising omissions. I could find no descriptions of desquamative vaginitis or focal vulvitis. However, I believe that this handbook could serve as an excellent basis for discussions between trainer and trainee and stimulate further reading around these topics.

Human papillomavirus infection

Assessing gains in diagnostic utility when human papillomavirus testing is used as an adjunct to Papanicolaou smear in the triage of women with cervical cytologic abnormalities.

HPV testing in primary screening of older women.

Do HPV-negative cervical carcinomas exist?—revisited.

CS HERRINGTON. J Pathol 1999;189:1–3

Human papillomavirus is a necessary cause of invasive cervical cancer worldwide.

JMM WALBOOMERS, MV JACOBS, MM MANOS et al. J Pathol 1999;189:12–9

Has the use of Pap smears reduced the risk of invasive cervical cancer in Guadalajara, Mexico?

M JIMINEZPEREZ, DB THOMAS. Int J Cancer 1999;82:804–9

Familial risks in cervical cancer: is there a hereditary component?

K HEMINKE, CH DONG, P VAATTINEN. Int J Cancer 1999;82:775–81

Human papillomavirus infection, cervical dysplasia and invasive cervical cancer in Honduras: a case-control study.

Human papillomavirus-associated perineal squamous cell carcinoma in HIV-positive patients.

Enhancement of the innate and cellular immune response in patients with genital warts treated with topical imiquimod cream 5%.

Intramuscular or topical cidofovir for the treatment of recurrent genital warts.

Histologic and immunologic associations of an HPV16 variant in low-grade smears.

Seroprevalence of human papillomavirus type 16 in pregnant women.

Serum antibodies to human papillomavirus 16 proteins in women from Brazil with invasive cervical carcinoma.

Serological evidence for protection by human papillomavirus type 6 infection against HPV type 16 cervical carcinogenesis.

The integration of HPV-18 DNA in cervical carcinoma.

High prevalence of human papillomavirus type 58 in Chinese women with cervical cancer and precancerous lesions.

Use of a hybrid capture assay of self-collected vaginal swabs in rural Uganda for detection of human papillomavirus.

A quantitative polymerase chain reaction–enzyme immunoassay for accurate measurements of human papillomavirus type 16 DNA levels in cervical scrapings.

MV JACOBS, J WALBOOMERS, J VANBEK et al. Br J Cancer 1999;114:21

Degenerate and nested PCR: a highly sensitive and specific method for detection of human papillomavirus infection in cutaneous warts.

Analysis by multiplex PCR of the physical status of human papillomavirus type 16 DNA in cervical cancers.

HPV typing and HPV16 E6-sequence variations in synchronous lesions of cervical squamous-cell carcinoma from Swedish patients.

XJ JU, ZW GUO, J TIANJUN et al. Int J Cancer 1999;83:34–7

Human immunodeficiency virus infection in vitro activates naturally integrated human papillomavirus type 18 and induces synthesis of the L1 capsid protein.

Chimeric virus-like particles of the human papillomavirus type 16 as a prophylactic and therapeutic vaccine.

A recombinant human papillomavirus type 16 L1-vaccina virus murine challenge model demonstrates cell-mediated immunity against HPV virus-like particles.

Nasal immunization of mice with human papillomavirus type 16 virus-like particles or with the HPV-16 L1 gene elicits specific cytotoxic T lymphocytes in vaginal draining lymph nodes.

Mucosal but not parenteral immunization with purified human papillomavirus type 16 virus-like particles induces neutralizing titers of antibodies throughout the estrous cycle of mice.

p53 codon 72 arg/pro polymorphism is not related to HPV type or lesion grade in low- and high-grade squamous intraepithelial lesions and invasive squamous carcinoma of the cervix.
A GIANNOUNDIS, DA GRAHAM, SA SOUTHERN, CS HERRINGTON. Int J Cancer 1999;83:66–9

E7-specific cytotoxic T cell tolerance in HPV-transgenic mice.

Establishment of the human papillomavirus type 16 life cycle in an immortalized human foreskin keratinocyte cell line.
ER FLORES, BL ALLENHOFFMANN, D LEE et al. Virology 1999;262:344–54

Papillomavirus E1 induces p53-independent apoptosis in HeLa cells.
C DEBAINTE, S GOYAT, S GARBAY et al. Oncogene 1999;18:4538–45

Transcription-modulatory activities of differentially spliced cDNAs encoding the E2 protein of human papillomavirus type 16.
N ALLOUL, L SHERMAN. J Gen Virology 1999;80:2461–70

The human papillomavirus 18 oncoprotein physically associates with Tyk2 and impairs Jak-STAT activation by interferon-a.

Cervical cytology and colposcopy

Organised vs spontaneous pap-smear screening for cervical cancer: a case-control study.
P NIEHENN, M KALILIO, A ANTITLA, M HAKAMA. Int J Cancer 1999;83:55–8

A ANTITLA, R FORKALA, B SODERMAN et al. Int J Cancer 1999;83:59–65

Beliefs about Papanicolaou smears and compliance with Papanicolaou smear follow-up in adolescents.

Follow up of women with borderline cervical smears as defined by national guidelines.

The clinical significance of the poor correlation of cervical dysplasia and cervical malignancy with referral cytologic results.

See-and-treat in the management of high-grade squamous intraepithelial lesions of the cervix: a resource utilization analysis.

Angiogenesis in cervical intraepithelial neoplasia and the risk of recurrence.

Hormone receptor status in cervical intraepithelial neoplasia: correlation with the stage of disease.

Atypical immature metaplastic-like proliferations of the cervix: diagnostic reproducibility and viral (HPV) correlates.
JJ PARK, DR GENEST, DQ SUN, CP GRUM. Hum Pathol 1999;30:1161–5

Abnormal Fhit expression in malignant and premalignant lesions of the cervix.

Other sexually transmitted infections

Serologic evidence of human herpesvirus 8 transmission by homosexual but not heterosexual sex.
NA SMITH, CA SABIN R GOPAL et al. J Infect Dis 1999;180:600–6

Immune cells are required for cutaneous ulceration in a swine model of chancroid.
LR SANMATEO, EL TOFFER, PE ORNDORFF, TH HOLSCHNEIDER, L GHOSH, FJ MONTZ. J Infect Dis 1999;180:600–6

Examination of early interactions between Haemophilus ducreyi and host cells by cocultured HaCaT keratinocytes and foreskin fibroblasts.
FR ZARETZKY, TH HOLSCHNEIDER. J Infect Dis 1999;180:600–6

Practice patterns for the elicitation of sexual history, education and counseling among providers of STD services: results from the gonorrhea Community Action Project (GCAP).
SS BULL, C RITMEIJER, JD FORTENBERRY et al. Sex Transm Dis 1999;26:584–9

Microbiology and immunology

Roles of glycoproteins and oligosaccharides found in human vaginal fluid in bacterial adherence.

Identification of and hydrogen peroxide production by fecal and vaginal lactobacilli isolated form Japanese women and newborn infants.

Relationship between Ureaplasma urealyticum vaginal colonization and polymorphism in the interleukin-1 receptor antagonist gene.
