**Resurgence of syphilis in England**

In their commentary on the resurgence of syphilis in England, Fenton et al cover issues surrounding controlling outbreaks of syphilis, quoting parallels in the United States, and identify the need for simple treatment, preferably with a single dose regimen.

Two important differences between the two countries in management strategy that could be relevant to the current UK situation are, however, not discussed. Firstly, variation in penicillin treatment regimens: in the United States single dose benzathine penicillin is recommended for primary, secondary, and early latent syphilis, whereas in the United Kingdom, 10 days of procaine penicillin is preferred regimen except when compliance is likely to be a problem.

Secondly, epidemiological treatment of sexual contacts is a policy pursued actively in the United States but not in the United Kingdom.

These differences have evolved as responses to the epidemiological patterns of syphilis in the two countries. In the United States outbreaks of syphilis are well recognised whereas in the United Kingdom they are a relatively new phenomenon. Given the success in managing outbreaks in the United States it might be relevant to review proved aspects of syphilis management using single dose benzathine penicillin, as in the United States, that could be applied in the United Kingdom. Adopting this treatment regimen would also open the way for other effective treatment strategies such as selective mass treatment and epidemiological therapy in high prevalence populations. The issue of compliance withprotracted regimens of procaine penicillin, a problem that takes up considerable time of genitourinary medicine clinic staff, would also be solved. Although concerns about using a single dose of benzathine penicillin in HIV positive subjects with advanced immunosuppression have been raised, possible treatment failures are still at the case report stage. Furthermore, there are no documented treatment failures in Africa where the prevalence of syphilis and HIV is the highest. World Health Organization currently recommends that HIV infected patients with early syphilis are treated no differently from non-HIV infected patients and recommends single dose therapy.

In trying to identify new interventions to improve STI control for limiting the spread of HIV, the basic principles of STI control are, if anything, more relevant today compared with the past. Although the issues and arguments raised here have been discussed in depth previously, they bear repeating in light of the recent increase in syphilis in the United Kingdom.

**Vulvovaginitis due to fluconazole resistant Candida albicans following self treatment with non-prescribed triazoles**

Resistance of *Candida albicans* to triazoles is uncommon with short term treatment but has been increasingly reported in immunocompromised patients, including those with HIV infection who are receiving long term systemic or maintenance therapy. Vaginal triazole resistant *C. albicans* isolates are extremely rare in non-immunocompromised women. To our knowledge, only a single case has been reported in a UK patient.

As the counter oral triazole antifungals are now widely available there is potential for drug resistance to increase. We report another case of vulvovaginitis due to triazole resistant *C. albicans* in an otherwise healthy woman.

The patient was a 28 year old woman who presented with symptoms of vulval pruritis and profuse vaginal discharge for six months. She was not taking regular medication but had used clotrimazole and fluconazole several times in the preceding months. The clinical improvement on examination, the vulva looked healthy but the vagina was erythematous and white plaques were noted. The cervix appeared normal and bimanual pelvic examination was unremarkable. The patient declined HIV serology but was fit and well with no stigmata of HIV infection and no risk factors.

Microscopic examination of vaginal secretions did not reveal any yeast blastospores or pseudohyphae, nor any clue cells or trichomonads. However, *C. albicans* was isolated on culture. In view of the documented history of lack of response to topical antifungal treatment, the patient was treated with nystatin pessaries daily for two weeks, while antifungal sensitivity tests were being performed. The patient returned to clinic two weeks later and reported only slight improvement in her symptoms, despite using vaginal nystatin as prescribed. Unfortunately, the sensitivity test results were not available at this time and the patient subsequently failed to attend the clinic.

Will the legalisation of street sex work improve health?

The legalisation and regulation of street sex work in Victoria, Australia, is likely to improve the health of street sex workers and their clients.

In Victoria, street sex work is illegal. In comparison, brothel and escort agency sex work is legal, and these individuals are required by law to have monthly certification of STI screening. Any incident infections are detected early and treated so that the prevalence of STIs is low.1

The legalisation and regulation of street sex work in Melbourne has been recommended.3 Currently, a 2 year trial of designated areas for street sex work in Melbourne has been recommended.4 These recommendations were to protect the health of street sex workers and their clients, in addition to the targeted intervention described here. Further research is needed into the best health promotion model for street sex workers.

Adult and paediatric contact immunotherapy with squaric acid dibutylester (SADBE) for recurrent, multiple, resistant, mucocutaneous anogenital warts

Treatment of recurrent anogenital warts is often troublesome, because, using the various treatment modalities currently available, few are uniformly effective or virucidal.5 Currently, topical immunotherapy with squaric acid dibutylester (SADBE) represents an effective treatment in the management of multiple plantar and common warts (table 1 below).6,7 In the genital area the use of SADBE has some limitations, as it may be associated with a significant degree of irritation that produces considerable discomfort to the patient. Based on studies showing excellent results (87% of patients with complete resolution) achieved by some authors in treating condylomata acuminata of the endocervix with applications of dinitrochlorobenzene (DNCB), a substance similar to SADBE, utilising remote anatomical site applications to the skin of the arm,8 and our personal observation of spontaneous regression for untreated warts during contact immunotherapy with SADBE for alopecia areata,9 we decided to compare the results

obtained in the management of multiple and resistant anogenital warts by applying SADBE directly to the lesions with those obtained by applying it to remote unaffected areas.

From June to December 1999, nine patients, seven adults (mean age 32 years) and two children (mean age 10.5 years), were treated. Following sensitisation by topical application of 3% SADBE in acetone directly to the skin of the pubic region in adults and to the back of the hands in children, serial dilutions (0.0003% to 3%) were tested 2 weeks later on the same skin area in order to evaluate the minimal concentration capable of eliciting an eczematous reaction. Subsequently, the application of the compound was performed in the clinic by trained staff twice a week. SADBE application varied by age of patients and anatomical site of lesion. In children, SADBE was applied to the dorsal left hand; in adults it was directly applied to lesions located on skin, or to the pubic area when lesions were located on mucosa. If an eczematous reaction was not elicited after 1 week, an incrementally higher concentration was applied. If a strong reaction ensued, the treatment was discontinued for 3–6 days and an incrementally lower concentration was used at the following visit.

A total of eight patients completed the therapy, showing complete resolution after a mean of 16 weeks of treatment, with variable concentrations of SADBE ranging from 0.0003% to 0.3% (table 1). Local side effects (erythema, desquamation, cutaneous oedema, pruritus, burning, and pain) were generally mild and well tolerated. No relapses occurred during an 18 month follow up.

Clinical resolution and length of treatment in patients treated by applications to remote areas was comparable with those in which SADBE was applied directly to lesions. These results not only substantiate the efficacy and safety of topical SADBE in the treatment of multiple recurrent/recalcitrant anogenital warts, but also indicate a possible systemic effect of contact immunotherapy, suggesting that the mechanism of action of SADBE could be mediated by a non-specific inflammatory reaction or a local cell mediated process triggered by a non-antigenic immune stimulus.

HIV negative certification and sexual health issues facing performers in the adult entertainment industry in the UK

The production of adult entertainment videos in the United Kingdom has increased in the past 2 years. In July 2000 the British Board of Film Classification introduced changes to the “Restricted 18” (“R18”) classification of videos, legalising the sale of videos featuring explicit images of real sex to people who are 18 years or older. The Board of Film Classification has already classified 485 “R18” videos, compared to a total of 651 videos in 2001.

The majority of adult entertainment videos are produced showing images of real unprotected sex without condoms, and concerns that these videos are achieving ‘some viewers an impression that sex without condoms is safe has prompted a recent initiative by the British Board of Film Classification to introduce safer sex health messages as a standard on all “R18” videos. This initiative is supported by the Department of Health, the Public Laboratory Service, and the Terrence Higgins Trust. The British Board of Film Classification has indicated a willingness to collaborate with the major distributors of “R18” videos in Britain in the production of a safer sex message. It is notable that such safer sex messages already exist in some adult videos in the United States.

Central to the health and safety issues for performers of adult entertainment videos is the regulation of HIV negative certification. In the United States, where the estimated yearly income from pornography in 1997 was $2.5 billion, the adult entertainment industry responded to the HIV outbreak in the 1980s by introducing regular compulsory HIV antibody testing of performers involved in the production of images showing real unprotected sex. In 1998 former performers set up a clinical service, AIM Health Care Foundation, in collaboration with medical experts providing sexual health care and information specifically aimed at performers in the adult entertainment industry. AIM Health Care Foundation provides HIV testing and certification, STI testing and treatment, and provides free condoms, lubrication, and offers information and counselling. AIM Health Care Foundation serves 400 clients per month and runs an effective monitoring and partner notification system using a PCR/DNA test showing negative HIV status within the past 28 days. AIM Health Care Foundation also holds a database that allows producers to confirm that the performers comply with this testing programme, which has succeeded in controlling the spread of HIV in the adult entertainment industry. AIM Health Care Foundation recommends regular STI screening to all their clients. It estimates that in Los Angeles, where the majority of the adult entertainment industry in the United States is based, the prevalence of Chlamydia trachomatis genital infection is 10% higher than the national average. By providing health care and information, AIM Health Care Foundation has contributed towards the development of a more coherent and accountable infrastructure in the adult entertainment industry in the United States. Although the recent legal changes to the “R18” category have contributed to the growth of the adult entertainment industry in the United Kingdom, the industry still lacks a coherent infrastructure. Production budgets are low and there are no working contracts for the performers. The industry’s earnings and average employment periods for performers in the United Kingdom are lower compared with the United States. The lack of infrastructure in the adult entertainment industry in the United Kingdom is reflected in the poorly developed health and safety measures for performers. Previous research by one of us has found that, in contrast with the United States, the British industry standard requires performers to have a new HIV test every 30 days and to present their certificate on every job they are hired to do, the majority of performers in the United Kingdom have an HIV test every 3 months, and very few performers have regular STI screenings. This work has also highlighted the discrepancies between the NHS sexual health clinics in their practices of issuing HIV certificates, and show that most performers in the United Kingdom prefer to use private clinics for this service. This also raises the governance issue of the need to ensure accuracy of certification in issuing these certificates in order to avoid any fraudulent HIV negative certifications.

We have now developed a collaborative project, based on the original research by LG into the health issues in the adult entertainment industry. The HIV/GUM Directorate of the Chelsea and Westminster Hospital are conducting a pilot study of the detailed sexual health of adult performers in order to define their risk of sexually transmitted infections in work and private lives, as well as assessing their awareness of sexual health issues. Clearly the availability of condoms and HIV negative certification is an important issue for the strategic planning of sexual health services which data from more sources will inform.

ABC of AIDS. 5th ed.

Writing a good textbook on HIV infection is very difficult. Large textbooks that attempt to be comprehensive face the problem that, in what is now such a vast and rapidly moving field, they are out of date by the time they are published. Smaller textbooks on the other hand have to decide what to leave out. This book is clearly aimed as an introduction to the subject for people with much experience of HIV. Although not attempting in any way to be comprehensive, it is often remarkably detailed despite its brevity. I think that it is much the best of the short textbooks for a general readership. It is (relatively) cheap and unlike other books, it is so concise is likely to be read by those who buy it.

The best chapter is also the longest, on “Treatment of infections and anti viral therapy” (what else is there left?), which forms the core of the book. There are also two very readable chapters written by patients. If read together these three chapters make clear the profound changes that combination antiretroviral therapy has produced since 1996, in a way that some other chapters curiously do not. The chapter on gastrointestinal manifestations, for example, has been not revised significantly in this edition to reflect the impact of HAART.

The book has some shortcomings. There is little mention of the issue of late presentation of disease, which is a particular problem in the United Kingdom especially among those with heterosexually acquired infection; the sections on counselling and epidemiology fail to reflect this. The massive problem of co-infection with hepatitis C is touched on only briefly in two chapters. There is no separate section on women with HIV infection (although mother to child transmission is well covered in the paediatric section). While the colour illustrations are generally excellent, the reproductions of chest x rays are not so good, and the same mangled slide of a patient with pulmonary lymphoma found in earlier editions of the book is reproduced unchanged in this one. Finally, post-exposure prophylaxis is poorly dealt with, which is a shame as this is a topic likely to be of major interest to the general reader who has just pricked his or her finger with a bloodstained needle.

However, despite these qualifications, this really is a very good book. I hope the sixth edition is even better.

Human papillomaviruses.
Clinical and Scientific Advances.

Most of us have had an encounter with warts at some time in our lives. We try to freeze, poison, or corrode them, occasionally resorting to surgery, laser vaporisation and, latterly, immunotherapy. Our modest success at treatment only underscores the general public’s perception that warts are a common but incurable nuisance. All this trouble from a family of viruses with a host range that spans the animal kingdom and an astonishing spectrum of disease manifestations. The development and subsequent exploitation of increasingly sophisticated molecular techniques over the past 30 years have led to a rapid increase in the understanding of the biology of papillomaviruses, especially human papillomaviruses (HPVs). Much of this effort has focused on the propensity of certain HPV types to contribute to malignant transformation and, increasingly, on the potential for developing more effective therapies, including vaccines to prevent HPV associated cancers.

Jane Sterling and Stephen Tyring have managed to assemble a panel of clinical and scientific experts working on HPV and have produced a highly readable and concise account of the recent advances in our understanding of this fascinating infection. The chapters are laid out logically in three main parts—Molecular and Cellular Aspects, Diseases and Infections, and Future Prospects: treatment and basic research. The book is beautifully illustrated throughout, providing greater clarity in explaining complex molecular mechanisms as well as good clinical examples of the different types of HPV related diseases. Some overlap in coverage is inevitable in a multiauthour textbook but this does not detract from the consistently high quality of the finished product.

This book is ideal for both junior and senior staff who need to acquire some knowledge of the mechanisms and spectrum of HPV disease. The scientific reviews should prove useful to those sitting for postgraduate examinations and other (mischievous) purposes. Those of you who may have grown tired of the arrivistes’ staff room chants of Intention to Treat, BLQ (1 was always under the impression they were talking about bacon, lettuce, and tomato sandwiches), CYP3A4 inhibition, and K103N at every available opportunity will welcome this slim, lean textbook. A sharp riposte on the lines of, “that’s all very well, but did you know that the HPV 16 and 18 E7, like E1A and SV40 large T bind to the family of cellular proteins which include pRB, p107, and p130 and that the latter two complex with regulators of the cell cycle including members of the E2F family, cyclin A, and cyclin E, and participate in the regulation of both G1 and G2 cell cycle blocks . . .?” [p 26] should be sufficient to keep their overblown egos in check, albeit temporarily.

Understanding thrush, cystitis and women’s genital symptoms.

This book certainly compares favourably with some of the offerings available in our local pharmacies and health food shops. Overall, it gives a concise summary of female genital infectious problems and physiology in clear and accessible language. This is supplemented by a series of clear illustrations, case discussions, and summary boxes. As well as the general public, medical students and nurses might find this a useful and informative book.

While there were no major reservations about the book the title did seem a little misleading. Although “thrust” is covered well and sensibly it is only a relatively minor part of this book. Maybe it should have been called “women’s genital symptoms—including thrush, cystitis, and other infections.” Also it is not really relevant to perimenopausal and postmenopausal women and this isn’t made clear in the introduction. The only real shortcoming was that painful sex was given too little space and although vulvodynia is mentioned and indexed there is no mention of the vulval vestibulitis syndrome despite this being commonly misdiagnosed as “problem thrust.”

A good little book for the pharmacy bookshelf and to recommend to patients.
