

Key messages

- ▶ Adolescent girls and parents of adolescents perceive significant disruption in health-related quality of life when given the opportunity to evaluate potential outcomes associated with the disorder.
- ▶ Adolescents perceive lower health-related quality of life and are willing to trade more time to prevent pelvic inflammatory disease-related health states than adolescents.
- ▶ Future economic evaluations employing the patient perspective to determine resource allocation for pelvic inflammatory disease management in adolescents should consider inclusion of adolescent health utilities.

which patient-specific preferences are used to determine resource allocation for PID management in adolescents should consider inclusion of adolescent health outcomes and utilities.

Acknowledgements We are grateful to Dr Kenneth Smith for sharing the electronic survey used in his work with adult women for use in our adolescent-focused and web-based study methods.

Funding This study was funded by the Centers for Disease Control and Prevention (K01 DP00128-02).

Competing interests None.

Ethics approval Ethics approval was provided by Johns Hopkins University Institutional Review Board; Baltimore City Health Department Research Review Committee.

Contributors Study design: MT, HL, KF and JME. Securing of research funding: MT. Programming/development of web-based elicitation survey: QQ. Analysis and interpretation of data: CT and MT. Drafting/review of manuscript: MT, HL, KDF, QQ, JME and CT.

Provenance and peer review Not commissioned; externally peer reviewed.
