
In its fifth report (1960) the WHO Expert Committee on Venereal Infections and Treponematoses recommended that the WHO should show an active interest in all aspects of the world-wide public health problem of gonococcal infection and that the necessary intensified research should be included in the WHO research assistance programme. The present report records the proceedings and recommendations of the first meeting of the WHO Expert Committee on Gonococcal Infections, which was held in Geneva during November, 1962. This valuable report should be read by venereologists and all others interested in the difficulties which have so far prevented progress in controlling this widespread and prevalent venereal infection. S.M.L.

The XII International Congress of Dermatology held in Washington  D.C. in September, 1962, was attended by 2,301 members from 69 countries. The proceedings of the congress have now been published in two large volumes, which present a detailed picture of recent progress in the medical and scientific aspects of dermatology and venereology. Many of the review articles are of high standard and provide an excellent opportunity of keeping abreast with knowledge in several fields. As might be expected, the original contributions are more variable in quality, but examination of the reports will demonstrate the wide range of research activities which are now being carried on all over the world. The areas of common ground between dermatology and venereology are still very considerable and those who devote all their time to the study and treatment of the venereal diseases will find much that is instructive and helpful in the sections dealing with dermatological matters.

The section concerned with treponemal diseases and non-treponemal venereal diseases, including gonorrhoea, in the second volume, includes papers on the epidemiology of the treponematoses, on clinical, laboratory, and therapeutic problems, and on trichomoniasis, and there is a series on problems in the diagnosis and treatment of gonorrhoea. The major part of the discussion which followed is also recorded.

The standard of printing, binding, and reproduction of photographs is very high and the volumes will form a useful addition to a comprehensive medical or departmental library. R.D.C.

OBITUARY

MARY MICHAEL-SHAW, 1897-1963

Born on January 31, 1897, Mary Michael entered the London School of Medicine for Women in 1914, qualified with the conjoint diploma in 1922 and graduated M.B., B.S., in 1923. She was appointed house surgeon at the Royal Free Hospital and later held a house surgeon's appointment at the Lock Hospital where she started to gain experience of the subject to which she devoted her professional life.

She and her architect husband later went to Kenya where she became the medical officer in charge of child welfare and venereal diseases. In 1933, after some 5 years abroad, they returned to England and Dr. Michael-Shaw was appointed to the Venereal Diseases Department at the Royal Free Hospital. In 1938 she became Director of the Department, taking over on Dr. Margaret Rorke's retirement, and continued to administer this department until her own retirement in March, 1958. During these years she was appointed Teacher in V.D. in the University of London.

In 1939 she was appointed Medical Officer in Charge of the Special Clinic at the Salvation Army Mothers' Hospital in Clapton, a position which she held for 3 years. Her articles published in the Daily Mirror early in the second world war, first brought to the attention of the general public the rising incidence of V.D. and the dangers thereof. Shortly after the articles appeared, she was asked to join the Ministry of Health as part-time assistant to Col. L. W. Harrison, where the women's clinics became her special responsibility. She helped to put the venereal diseases into proper perspective and worked hard to encourage her patients to understand more about their disease and to face the future without the terrible sense of guilt which oppressed so many of them. She had considerable knowledge of prevailing social conditions and her interest in her patients extended well beyond the clinic walls. Many of them had reason to be grateful to her for her kindness and practical help. She was particularly interested in the problems of syphilis in pregnancy. Always ready with pertinent advice, both medical and otherwise, she was a member of the committee which ran the Highbury Hostel for unmarried
