against one of our isolates neutralised proteotype adenovirus 37 but not prototype adenovirus 19 (obtained from Fairfield Hospital, Fairfield, Victoria) when 20 doses of antisera were tested against 100 infectious doses of virus. A close antigenic relationship was found to exist, however, between adenovirus 19 and 37, leading to confusion in identification of the latter serotype when, for convenience, neutralisation tests were set up with 20 neutralising doses of antisera against untitrated newly isolated virus.

The results shown in the table clearly indicate that both adenovirus 19 and 37 infect the human genital tract. We have

<table>

</table>

confirmed the evidence obtained by de Jong et al.2 for the occurrence of adenovirus 37 in the eye and genital tract. These findings represent the first report of isolation of adenovirus 37 in the southern hemisphere (de Jong, personal communication). Extrapolation from these results to those we reported previously1 would suggest that about 8% of isolates were adenovirus 19 and approximately 92% adenovirus 37. The association of human genital adenovirus infections with types 19 and 371 2 4 6 has been extended by other unpublished results from this laboratory showing that adenovirus 8, 9, 10, and 26 can also be isolated from genital specimens. It should be noted that all genital isolations of adenoviruses 8, 9, 10, and 26 in this laboratory and the two adenovirus 19s referred to in the table are neutralised only by the homologous WHO specific antiserum and not by antiserum to prototype adenovirus 37.

All the above adenoviruses belong to the human erythrocyte-agglutinating subgroups3 of Rosen's group II adenoviruses. It would be of interest to determine whether other members of these subgroups have a similar predilection for the mucous membranes of the genital tract and the eye. In the near future we will be reporting in more detail our laboratory and clinical findings in human genital adenovirus infections.

TO THE EDITOR, British Journal of Venereal Diseases

An outbreak of gonorrhoea due to penicillinase-producing Neisseria gonorrhoeae (PPNG) in a provincial city

Sir,

Between October 1980 and July 1981 52 patients (31 men and 21 women) with gonorrhoea due to penicillinase-producing Neisseria gonorrhoeae (PPNG) attended the clinic at Cardiff Royal Infirmary. During the previous 12 months only three such infections were recorded.

Patients with uncomplicated gonorrhoea whose secretions contained Gram-negative diplococci were treated routinely with ampicillin 2 g and probenecid 1 g by mouth. Cultures were performed on chocolate agar and modified New York City medium.1 Tests for sensitivity to penicillin and penicillinase production2 3 were carried out on all isolates. When infection by PPNG was established, patients were retreated with a single injection of 2 g spectinomycin. Four women infected with PPNG had complications (pelvic infection three and Bartholin's abscess one); they were treated with 1 g kanamycin daily for three days. Four men with PPNG infections developed epididymo-orchitis and were given co-trimoxazole two tablets twice daily for seven days. One man had epididymitis at the time of his first visit, the other seven patients developed their complications within a week of their initial treatment with ampicillin and probenecid. During the period reviewed seven of 209 men and nine of 137 women infected with non-PPNG strains developed complications. The difference in incidence of complications due to infections with PPNG and non-PPNG strains is significant (x2 = 7.435, p < 0.01). It was noted during the outbreak that the PPNG strains were gradually becoming resistant to other antibiotics.

Most of the patients infected with PPNG (86%) were Caucasians; the remainder were foreigners living in Wales.4 One patient was infected in Bangkok, the other infections

were contracted in the United Kingdom, and 60% of the men were infected by four Cardiff prostitutes. Fifty-two per cent of the patients were from the middle social classes, 16% came from a socially deprived background, and 32% were unemployed.

Yours faithfully,

L Cohen
K S Parka
