The silent suffering women

Jonsson et al.1 recently reported on a population-based study to assess the prevalence of lower genital tract symptoms and history of vaginal infections among women in a population-based setting. In this study, the prevalence of lower genital tract symptoms and signs was reported. The results showed that women aged 15-44 years had a higher prevalence of symptoms, with the most common being vaginal discharge, itching, and pain. The authors also noted that many women did not seek medical attention for their symptoms, and this may be due to a lack of awareness or stigma associated with genital tract infections.

Definition of vaginal infections of STDs.

We have previously found that the prevalence of lower genital tract symptoms increases with age, and that women aged 35-44 years have the highest prevalence of symptoms. The prevalence of symptoms decreases with age thereafter. The prevalence of symptoms is also higher in women who have been sexually active, and this suggests that sexual activity is an important risk factor for genital tract infections.

Symptoms and causes of vaginal infections.

Symptoms of vaginal infections are varied and can include vaginal discharge, itching, burning, pain, and odour. The causes of vaginal infections are also varied and can include bacteria, fungi, viruses, and parasites. The most common causes of vaginal infections are bacteria, and the most common bacteria are those that cause sexually transmitted diseases (STDs).
