Lymphatic filariasis—lest we forget

Editor,—Lymphatic filariasis is characterised by a wide range of clinical manifestations. In a non-endemic area the diagnosis may be missed unless the index of suspicion is high. An 18 year old sexually active male presented with a progressively increasing painless nodular swelling in the right inguinal region of 4 months' duration. The patient had an unprotected vaginal contact with a commercial sex worker 6 months earlier. There was no history of genital ulcer or urethral discharge. The general health of the patient was preserved. Examination revealed an enlarged right inguinal and external iliac lymph nodes, 1–3 cm in size, firm, mobile, non-tender, and matted with normal overlying skin. Examination of genital, anal, and buccal mucosae was normal. There was no lymphadenopathy. A differential diagnosis of lymphogranuloma venereum, chancroid, syphilis, tuberculosis, and lymphoma was considered. Complete blood count revealed mild leucocytosis and eosinophilia. Renal and hepatic functions, urinalysis, and chest X-ray were normal. Mantoux test and VDRL were negative. A complement fixation test for chlamydia group specific antibody was negative. Fine needle aspiration cytology from the nodes revealed reactive hyperplasia with occasional giant cells and microfilariae. The nodes regressed and no relapse was observed in 6 months of follow up.

The differential diagnosis of inguinal lymphadenopathy in a sexually active male includes syphilis, genital herpes, chancroid, LGV, syringo-adenitis, tuberculous, and lymphoma. In the present case a diagnosis of LGV was considered in view of a history of sexual contact, painless and non-suppurative lymphadenopathy not apparently preceded by a genital ulcer. Demonstration of microfilariae was decisive in clinching the diagnosis of filariasis which was not considered in the differential diagnosis. Presentation with inguinal lymphadenopathy is a feature common to both LGV and filariasis. The most frequent manifestation of secondary stage of LGV in men is unilateral inguinal lymphadenopathy which does not suppurate in two thirds of cases. Inguinal lymphadenopathy often develops in LGV as was observed in our patient. Painful enlargement of inguinal lymph nodes with fever is the usual presentation in lymphatic filariasis. Lymphangitis can accompany recurrent attacks. Other complications include orchitis, funiculitis, and epididymitis. These were, however, absent in our patient. It is suggested that lymphatic filariasis should be considered in differential diagnosis of inguinal lymphadenopathy even in areas which are not known to be endemic for it. It is otherwise likely to be missed.

Canary to sparrow; what is in a name?

Editor,—The Contagious Diseases Act of 1864 allowed for the compulsory arrest, examination, and treatment of women considered (by an all male board) to be of loose morals. Women were detained in the so-called “Canary wards” and their identity made clear by the bright yellow garments they were made to wear. In the year 2000, there is still perceived stigma and blame associated with the diagnosis of sexually transmitted infections (STIs) and this must be minimised if a screening programme for chlamydia is to be successful. It will help reduce stigma if people know and accept that it is not a disease of a few readily identifiable groups but is common and easy to acquire. It has been estimated that one in 14 young people will acquire it at some time.

In the NHS chlamydia pilot screening programme in Wirral and Portsmouth we are confirming that this infection is indeed endemic. Information material for the pilot study clearly states that it is a very common infection. To reduce the element of blame, we have included text saying that it can happen to anyone. We have introduced instead of sexually transmitted infections the term “sexually shared infection.” However, certain crucial issues remain unanswered. This acceptability survey was done among women aged 18–25 years and men 18–30 years. What happens with people below the age of 18? We know that Chlamydia trachomatis prevalence is associated with young age, but can we also send home screening kits to 15 year olds? What about the parental opinions and legal implications—for example, for the partner of a C trachomatis positive youngster?

In two surveys performed in general practice in Amsterdam, Netherland, in 1998, systematic and opportunistic screening, prevalence was strongly associated with young age but also with ethnicity. Among young Surinam-Antillian women aged <25 years, prevalences ranged from 5% in the opportunistic screen to 22.4% in the opportunistic survey. In the systematic survey an unexpectedly high C trachomatis prevalence of 10% was found among young Surinam-Antillian men. Among the 15–19 year olds visiting our centre in Amsterdam which is located in a multiethnic neighbourhood, half of the population having a Surinam-Antillian background, C trachomatis prevalence was 25%.

Thus, the question is not whether we can accept home screening for the youngest age group, who might be most at risk, but also how acceptable home testing is for people with different ethnic backgrounds and people living in low socioeconomic status and high risk environments.

We piloted a pharmacy assisted approach offering urine home testing to all sexually active women age 15–30 years. We came to our pharmacy to collect their contraceptives. Since the start 4 months ago 189 people received an information leaflet and home test package together with their contraceptives.

Fifty nine participated and sent their urine; four were positive (6.7%). The participation rate was 31%, lower than the reported rate for women in the article of Stephenson et al.

The assumption by the authors that people who do not participate for home screening will turn up for opportunistic screening at the general practice is, however, merely a hypothesis, and not a strong one, especially not for boys and men.

Tackling issues like risk perception and risk environment and changing healthcare seeking behaviours is not an easy task. Moreover, a community based C trachomatis prevention programme will require not only second generation prevention by active case finding but also primary prevention. What is needed is an integrated set of strategies, which are mutually reinforcing and that are age, sex, culture, and context specific. Quite a challenge!

Nurse counselling for women with abnormal cervical cytology improves colposcopy and cytology follow up attendance rates

EDITOR.—A well organised cervical screening programme has considerable benefits; however, one negative aspect is anxiety associated with abnormal results. The NHSCSP guidelines state that an explanatory leaflet should be given to women with abnormal cytology and those being referred for colposcopy, with a verbal explanation wherever possible.

We assessed if there is any additional benefit from a verbal explanation, following written information, when an abnormal smear result is given, in understanding and future attendance for colposcopy and cytology follow up.

Between April and December 1998 we recruited 89 women with abnormal cytology. All women attending for results are given the NHSCSP leaflet “What your abnormal result means” if their smear shows borderline changes, mild, moderate, or severe dyskaryosis. The study women completed a questionnaire after reading the leaflet. A nurse (BH) then gave a verbal explanation about the smear result. They then completed the questionnaire again. Attendance for colposcopy and cytology follow up was recorded, default being defined as non-attendance without cancellation. Default rates were lower in those receiving the verbal explanation. Lerman et al found that women with abnormal cytology who defaulted colposcopy appointments were more worried about cancer with impairment of mood and sleeping. Following the explanation our default rate for colposcopy was within the 15% recommended target, and follow up cytology was similar to the rates reported in primary care.

There are deficits in this study. The lack of randomisation means the improvement in default rates could be the result of baseline differences rather than the verbal explanation. However, it has shown benefit to the women by improving understanding. The department has also benefited; although extra nursing time has been required, the lower default rates reported in primary care.

Between 1995 and 1997 the Department of Health, to investigate the feasibility of screening 16–25 year old women (and some men), for chlamydia, using a specimen from the cervix. Antibiotics are cheap and effective. The cost of complications to the individual is enormous, as is the cost to the NHS—£200 million per year. Screening reduced the prevalence of infection in Sweden and the United States. Computer modelling suggests that screening in this country would be cost effective.

After screening for chlamydia, a means of contacting clients to give results was arranged—for example, letter or phone call. On the Wirral, 2651 patients were screened in the first 4 months—2332 women and 285 men (34, sex not recorded). Sixty eight (2.6%) gave a mobile phone number, half (35) using this as their only means of contact. Sixty five were female and two male (one patient not recorded). Thus, women (2.8%) were more likely to use mobile phones than men (0.7%) (p<0.03). The genitourinary medicine (GUM) clinic screened 358 patients. Only 68 (19%) gave an address. The results of a further 469 (17.7%) of the screened population went back to the screening site. These clients could be interested in contact via mobile phone if it was openly offered (data collected from the Public Health Laboratory Service (PHLS) database and analysed on SPSS/INFO 6). According to a survey by NOP Social and Political, confidentiality is important to people in the target age group (unpublished data). Patients consider their mobile phones to be a secure method of communication between themselves and us. The advent of DNA amplification in the detection of STIs has opened up new possibilities. There are 30 000 websites pertaining to chlamydia. An internet clinic would be aimed at mildly symptomatic or asymptomatic patients. The client would access the website and request swabs or urine pots through the post then return them the same way.

If the patients were positive, they would need to attend a GUM clinic or equivalent.

</table>
Other infections should not be overlooked. Partner notification is necessary. Contact slips could be supplied but the health adviser’s role should not be underestimated. Security on the internet would have to be addressed. However, the anonymity and convenience of participating from home may increase testing for STIs. This may appeal to younger patients particularly, in view of their experience with IT.

In summary, STI is rising in the younger population. Their utilisation of technology is demonstrated by mobile phone use in the chlamydia pilot study. Health providers should respond using media with which the target population is comfortable. We might just access a whole generation. The future’s bright . . .

Conflicts of interest: None.

Funding of chlamydia pilot study: Department of Health.

Gonorrhoea: an incidence graph of Mersey region data for the 1990s and discussion on the factors behind the changing pattern of incidence

EDITOR,—Gonorrhoea is one of the oldest and a highly infectious sexually transmitted infection. Its prevalence is dynamic and fluctuates over time and is influenced by a number of factors. The incidence of this infection has changed from a trend of steady decline to a recent increase in many parts of the world.1 The pattern of incidence is closely related to socioeconomic conditions.2

An incidence graph of Mersey Region figures (fig 1) for the 1990s and a discussion on the possible factors associated with the changing pattern is presented here. The incidence from the Mersey Region shows a steady decline until the mid 1990s followed by a recent increase and represents the trend in most areas. In spite of the advances in the diagnostic and therapeutic field, organised health advisory system, easy access walk-in clinics, complete confidentiality, and free treatments; the incidence of gonorrhoea is rising. From the broader analysis of the situation, it is possible to say that most of the factors behind this changing pattern are socioeconomic. The factors may include advances in contraceptive, sexual liberalisation, increase in the mobility of population, and the changing economic environment. The cumulative result of all these factors is an increase in casual relationships. Casual sex is made riskier when it is performed unprotected and without much knowledge about the partner and is possibly the main reason behind the poor contact tracing of only 0.5 out of an average of 1.5 per patient.3

Some of these factors are part of the wider evolutionary process and are difficult issues to deal with, but preventive measures may be taken against others. In spite of the recent advances and better understanding of the disease in the recent years, there is still a lack of awareness, in the general population, of the possible mental and physical effects of such infection. The significant fall in the incidence of gonorrhoea seen in the late 1980s, secondary to extensive media coverage of HIV infection, shows how effective such campaigns can be. The present rise in the incidence of gonorrhoea in the past few years shows clearly that our prevention campaigns are not effective.4

The young teenagers who make up the pool of supply and the young females who make up the pool of asymptomatic reservoirs of the infection, are the two core groups our campaigns should be targeting. At present there is no programme in the school curriculum about sexual health and no regular screening programme for sexually active young females. A programme of long term measures, such as education on sexual health and sexually transmitted infections in schools, and a programme of regular screening for gonorrhoea (and chlamydia) for all sexually active young females, may be useful and this can be, to start with, combined with the cervical smear screening programme at very little additional cost. Short term programmes, like vigorous media campaigns nationally and locally, and leaflet campaigns locally in high risk recreational areas like pubs and clubs, may have an educational value and help reduce the incidence.

Cheilitis in association with indinavir

EDITOR,—There is increasing speculation that indinavir may cause side effects which have been previously associated with high concentrations of retinoids. In the presence of all-trans-retinoic acid (ATRA), indinavir, but not other protease inhibitors (PIs), alters stem cell differentiation in vitro, not seen in the presence of ATRA alone.1 Alopecia and cheilitis are two side effects associated with both retinoids and the protease inhibitor indinavir (but not with any of the other protease inhibitors). These side effects can be.

Figure 1 Total incidence of gonorrhoea in the Mersey Region in 1990–9 (in absolute numbers).

This book is a must for anyone interested in how this fascinating organism causes disease. The first part reviews the knowledge on the molecular phylogeny, genomic autobiography, developmental biology, and metabolism of chlamydiae. It shows how far our knowledge of the organism has broadened in the past few years, particularly as gene sequencing has changed our view of chlamydiae. Until this was made available, metabolic studies on chlamydiae were hampered by its intracellular obligatory nature, lack of knowledge of the enzyme pathways, and the relatively small genome which suggested very limited metabolic activity. It now becomes apparent that the organism, which we believed to be biologically crippled, has quite sophisticated biosynthetic capabilities. This opens the way to creating a non-cell dependent culture system in the future.

A chapter by Ted Hackstadt on the cell biology shows a whole spectrum of novel interactions with the host cell that contribute to the success of the genus as pathogens. This is followed by an excellent chapter by Julius Schachter on infection and disease epidemiology. He makes the interesting point that given that some individuals lose antibody over time it is possible that almost all humans have met the organism at sometime in their lives. This may be quite important in understanding some of the longer term consequences of chlamydial infections, where the organism may not be isolated and antibody tests may be negative. These sequelae are covered in subsequent chapters by Michael Ward, Robert Brumam, and Roger Rank. Since all three chapters point to an immunological response to chlamydia there is bound to be some overlap, but also some differences and interesting emphasis. For example Ward plays down the current obsession with cross reactions between chlamydia and human heat shock proteins.

A lot of our information, particularly on the immunology, comes from animal studies and their relevance to human pathology remains to be established. In an excellent final chapter Penelope Hitchcock points to the future directions of research. In particular, she laments that little research has been done in men with chlamydia. Certainly the book is rather short on discussion of the male. There is also a need to find a male model for pathogenesis. Non-gonococcal urethritis maybe a suitable, and easily accessible, marker of chlamydial infection in men and deserves more in-depth study. Much more research also needs to be done, particularly, on clinically inapparent infections in the human. This book is a must for all those interested in this fascinating organism. Perhaps while not losing sight of the “why” and the “how” of sexual transmission we should also divert some resources into the “how” of its damage.

CURRENT PUBLICATIONS

Selected titles form recent reports published worldwide are arranged in the following sections:

Gonorrhoea
Chlamydia
Candidiasis
Bacterial vaginosis
Trichomoniasis
Pelvic inflammatory disease
Syphilis and other treponematoses
Hepatitis
Hepatitis B
Human papillomavirus infection
Cervical cytology and colposcopy
Other sexually transmitted infections
Public health and social aspects
Microbiology and immunology
Dermatology
Miscellaneous

Gonorrhoea

Gonorrhoea, chlamydia and the sexual network—pushing the envelope (Editorial).
JM ZEKLIMAN. Sex Transm Dis 2000;27:224–5

Gonorrhoea in male adolescents and young adults in Newark, New Jersey—implications of risk factors and patient preferences for prevention strategies.
KJ MURPAY, LF FISSELI, WC LIVIEN and et al. Sex Transm Dis 2000;27:201–7

Comparative epidemiology of heterosexual gonococcal and chlamydial networks—implications for transmission patterns.

Chlamydia

Unique gonococcal phenotype associated with asymptomatic infection in men and with erroneous diagnosis of nongonococcal urethritis.
WH WHITTINGTON, KK HOLMES. J Infect Dis 2000;1044–8

Asymptomatic infections have been associated with strains of Neisseria gonorrhoeae belonging to certain phenotypes; arginine, hypoxanthine, and uracil requiring (AHU) and proline, citrulline, and uracil requiring (PCCU). This study describes an outbreak caused by a new phenotype, citrulline and uracil requiring, which has unique clinical presentation. The authors report an increase in the prevalence of gonococci belonging to the CU auxotype from 1.6% in 1987 to 16.5% in 1997 in King County, Washington, USA. The characteristics of the CU auxotype may enable these strains to evade detection and hence confer a selective advantage for survival. This is of particular significance in light of the fact that total numbers have fallen and the pressure for screening asymptomatic populations has decreased.
Neisseria gonorrhoeae MS11 mKpC opacity protein expression in vitro and during human volunteer infectivity studies.
KA SCHMITT, CD IDEAL, MW IAN and et al. Sex Transm Dis 2000;27:278–83

Gonococcal lipo-oligosaccharide is a ligand for the asialoglycoprotein receptor on human sperm.

Reexamining the prevalence of Chlamydia trachomatis infection among gay men with urethritis—implications for STD policy and HIV prevention activities.
EL GHENES, J FLOOD, CK KENT and et al. Sex Transm Dis 2000;27:249–51

Multiple drug-resistant Chlamydia trachomatis associated with clinical treatment failure.

CORRECTION

An error occurred in the editorial by R D Maw which was published in the June issue (STI 2000;76:153). In the second column, line 3–6, podophyllin should be replaced by podophyllotoxin in each case.
Prevalence of Chlamydia trachomatis in urine of male patients with ankylosing spondylitis is not increased.

The value of Chlamydia trachomatis antibody testing as part of routine infertility investigations.

Low correlation of serology with detection of Chlamydia trachomatis by ligase chain reaction and antigen EIA.

The relationship of inflammation in the Papanicolaou smear to Chlamydia trachomatis infection in a high-risk population.
RI PALER, DR SIMPSON, AM KAYE et al. Contraception 2000;61:231–4

In situ analysis of the evolution of the primary immune response in murine Chlamydia trachomatis genital tract infection.

Candidiasis

Practice guidelines for the treatment of candidiasis.

Candida vaginitis—self-reported incidence and associated costs.

Experimental candidiasis. Pathogenesis, prevention, therapy.
E SEGAL. Mycoses 2000;42:55–60

Estrogen effects on Candida albicans: a potential virulence-regulating mechanism.
QI ZHANG, M ESSMANN, ET BURT, B LARSEN. J Infect Dis 2000;181:1441–6

Investigation of α-glucosidase as a potential virulence factor of Candida albicans.

Cytokine modulation of specific and nonspecific immunity to Candida albicans.
L ROMANI. Mycoses 2000;42:45–8

Histidine kinase, two-component signal transduction proteins of Candida albicans and the pathogenesis of candidosis.
J A CALERA, R CALDERONE. Mycoses 2000;42:49–54

Differential activation of a Candida albicans virulence gene family during infection.

Bacterial vaginosis

Bacterial vaginosis.

Urinary tract infections in women with bacterial vaginosis.

Characterisation and selection of a Lactobacillus species to re-colonise the vagina of women with recurrent bacterial vaginosis.

Induction of human immunodeficiency virus type 1 expression by anaerobes associated with bacterial vaginosis.

Trichomoniasis

Consider diagnosis and treatment of trichomoniasis in men (Editorial).
JN KRIEGER. Sex Transm Dis 2000;27:241–7

Comparative prevalence of infection with Trichomonas vaginalis among men attending a sexually transmitted diseases clinic.

A meta-analysis of the Papanicolaou smear and wet mount for the diagnosis of vaginal trichomoniasis.

A novel cysteine proteinase (CP65) of Trichomonas vaginalis involved in cytoxicity.

Pelvic inflammatory disease

Risk factors for pelvic inflammatory disease in inner-city adolescents.
AL SUNS, F HOMEL, M HAMMERSCHLAG, K BROMBERG. Sex Transm Dis 2000;27:289–91

Syphilis and other treponematoses

Potential for community-based screening, treatment and antibiotic prophylaxis for syphilis prevention.
BB KAIN, KE MOONEY, G JOHNSON, TA FARLEY. Sex Transm Dis 2000;27:188–92

Posterior uveitis in patients with positive serology for syphilis.

Treponema pallidum surface immunofluorescence assay for serologic diagnosis of syphilis.

A pilot study evaluating ceftriaxone and penicillin G as treatment agents for neurosyphilis in human immunodeficiency virus-infected individuals.

Oposonic potential, protective capacity and sequence conservation of the Treponema pallidum subsp. pallidum Tp92.

Hepatitis

Natural history of hepatitis C: its impact on clinical management.
AM DERSCHEL. Hepatology 2000;31:1014–9

Seroprevalence and risk factors of hepatitis B, hepatitis C and human cytomegalovirus among HIV-infected and high-risk uninfected adolescents—findings of the REACH study.
CA HOLLAND, V NA, AB MOSCOCI et al. Sex Transm Dis 2000;27:296–302

Herpes

Herpes simplex virus type 1 as a cause of genital herpes: impact on surveillance and prevention.

Testing for herpes simplex virus type 2—full steam ahead? (Editorial).

HSV-2 specific serology should be offered routinely to antenatal patients.

HSV-2 specific serology should not be offered routinely to antenatal patients.

Seroprevalence of herpes simplex virus type 2 infection among attendees of a sexually transmitted disease clinic in Italy.

Herpes simplex virus-type 2 seropositivity in a Danish adult population denying previous episodes of genital herpes.
CS. PETERSEN, FG. LARSEN, C. ZAHRADÁK, M. HEIDENHEM. Acta Dermato-Venereal 2000;80:158

www.sextransinf.com
Seroprevalence of herpes simplex virus type 1 and type 2 in selected German populations—relevance for the incidence of genital herpes.

Valaciclovir—a review of its long term utility in the management of genital herpes simplex virus and cytomegalovirus infections.

Characterization of an acyclovir-resistant herpes simplex virus type 2 strain isolated from a premature neonate.

HSV.com: Maneuvering the internet-works of viral neuropathogenesis and evasion of the host defense.

Premarket evaluation of the POCKit HSV-2 type-specific serologic test in culture-documented cases of genital HSV-2 type-specific serologic test in Premarket evaluation of the POCkit

1,3-dihydroxyacridone derivatives as inhibitors of herpes virus replication.

PAKANTAPACHAT, CT LOWDEN, KF BASTOW. Antiviral Res 2000;45:123–34

Hydrogels containing monencaprin prevent intravaginal and intracutaneous infections with HSV-2 in mice: impact on the search for vaginal microbicides.

Human papillomavirus infection

Papillomaviruses causing cancer: evasion from host-cell control in early events in carcinogenesis.

Contemporary theories of cervical carcinogenesis: the virus, the host and the stem cell.

A simplified and reliable HPV testing of archival Papanicolaou-stained cervical smears: application to cervical smears from cancer patients starting with cytological normal smears.

High prevalence of human papillomavirus type 16 infection among children.

Human papillomaviruses and vulvar vestibulitis.

Human papillomavirus DNA in penile carcinomas in Argentina: analysis of primary tumors and lymph nodes.

Comparison of human papillomavirus genotypes in archival cervical cancer specimens from Alaska natives, Greenland natives and Danish Caucasians.

Warty (condylomatous) squamous cell carcinoma of the penis—a report of 11 cases and proposed classification of ‘verruciform’ penile tumors.

Type of human papillomavirus and expression of p53 in elderly women with cervical cancer.

High prevalence of serum antibodies to Ras and type 16 E4 proteins of human papillomavirus in patients with precancerous lesions of the uterine cervix.

Boosting with recombinant vaccinia increases HPV-16 E7-specific T cell precursor frequencies of HPV-16 E7-expressing DNA vaccines.

Human tumor growth is inhibited by a vaccinia virus carrying the E2 gene of bovine papillomavirus.

Human papillomavirus type 16 E7 oncoprotein represses transcription of human fibronectin.

Interleukin-10 increases Th1 cytokine production and cytotoxic potential in human papillomavirus-specific CD8(+) cytotoxic T lymphocytes.

Cytokine profile of draining lymph node lymphocytes in mice grafted with synthetic keratinocytes expressing human papillomavirus type 16 E7 protein.

Cervical cytology and colposcopy

Advances in cervical screening technology.

MH Stoler. Mod Pathol 2000;13:275–84

Clinical significance of the qualification of atypical squamous cells of undetermined significance: an analysis on the basis of histologic diagnoses.

Qualitative analysis of value judgments in interpreting cervicovaginal smears using the Bethesda System

Papanicolaou smear history and diagnosis of invasive cervical carcinoma among members of a large prepaid health plan.

Cytologic and histologic diagnosis and significance of controversial squamous lesions of the uterine cervix.

Photodetection of cervical intraepithelial neoplasia using 5-aminolevulinic acid-induced porphyrin fluorescence.

PH Heilemann, HW Weggandt, RB Baumgartner et al. Cancer 2000;88:2275–82
Glandular lesions of the uterine cervix, RJ ZAINO. Mod Pathol 2000;13:261–74

The effects of loop excision of the transformation zone on cervical length: implications for pregnancy.

Treatment of vaginal dysplasia: just a simple loop electrosurgical excision procedure?

AL SADIK. Am J Obstet Gynecol 2000;182:866–71

Other sexually transmitted infections

Mycoplasma genitalium in males with nongonococcal urethritis—prevalence and clinical efficacy of eradication.

Development of a serological test for Haemophilus ducreyi for seroprevalence studies.

An isogenic hemoglobin receptor-deficient mutant of Haemophilus ducreyi is attenuated in the human model of experimental infection.

Public health and social aspects

A prospective study on condom slippage and breakage among female brothel-based sex workers in Singapore.
ML WONG, RKW CHAN, D KOH, S WEE. Sex Transm Dis 2000;27:208–14

Condom acceptance is higher among travelers in Uganda.
M MARRS, MJ WAWER, F MAKUMBI et al. AIDS 2000;14:733–42

Microbiology and immunology

Pathogenesis of abnormal vaginal bacterial flora.

Wet mount microscopy reflects functional vaginal lactobacillary flora better than gram stain.

Induction of mucosal immune responses in the human genital tract.

Surface characteristics of lactobacilli isolated from human vagina.
VS OCANA, E BRU, AAPD HOLGADO, ME NADERMA-CIASS. J Gen Appl Microbiol Tokyo 1999;45:203–12

Cytokine profile in genital tract secretions from female adolescents: impact of human immunodeficiency virus, human papillomavirus and other sexually transmitted pathogens.

Evidence that anoreceptive intercourse with ejaculate exposure is associated with rapid CD4 cell loss.
DJ WILEY, BR VISSCHER, S GROSSER et al. AIDS 2000;14:707–16

Dermatology

Recurrent squamous cell carcinoma of the vulva—clinicopathologic determinants identifying low risk patients.
M PRETI, G RONCO, B GHIRINGHELLO, L MICHELETTI. Cancer 2000;88:1869–76

Anaerobic blooponothiasis: two cases and review of the literature.
S TAVAKOLITABASI, RJ HAMILL, SB GREENBERG. Am J Surg Pathol 2000;24:11–4

Proliferative epidermal lesions associated with anogenital Paget’s disease.

Caruncles at the external urethral meatus.
D AOKI, K NOMATA, S KANDA et al. J Urol 2000;163:1518

Cutaneous metastatic carcinoma of the penis: suspected metastasis implantation from a bladder tumor.

Miscellaneous

When is a sexually transmitted disease not an ‘STD’?

Notify or not to notify—STD patients’ perspectives of partner notification in Seattle.

Treatment of sexually transmitted bacterial diseases in pregnant women.
GGG DONDEDES. Drugs 2000;59:377–86

Traditional intravaginal practices and the heterosexual transmission of diseases—a review.
JH BROWN, RC BROWN. Sex Transm Dis 2000;27:183–7

Extent of regretted sexual intercourse among young teenagers in Scotland: a cross sectional survey.
D WIGHT, M HENDERSON, G RAAB et al. BMJ 2000;320:1243–4

Sexually transmitted infections in European HIV-infected women: incidence in relation to time from infection.
JH BROWN, RC BROWN. Sex Transm Dis 2000;27:183–7

Prevalence and characteristics of sexual abuse in a national sample of Swedish seventeen-year-old boys and girls.
K EDGARDH, K ORSTAD. Acta Paediatr 2000;89:310–9

Antibiotics for bacterial prostatitis.
J MCfIE.  J Urol 2000;163:1407

Saw palmetto for the treatment of men with lower urinary tract symptoms.
JS GEBBELL.  J Urol 2000;163:1408–12

Cost utility analysis of sildenafil compared with papaverine-phenololamine injections.
EA STOLK, JH BUSCHBACH, M CAFFA et al. BMJ 2000;320:1165–7

Non-Hodgkin’s lymphoma involving the vagina—a clinicopathologic analysis of 14 patients.

S HANFE FESCHEL. Cancer 2000;88:2319–25

Finger-length ratios and sexual orientation.
TJ WILLIAMS, ME PEPTONE, CH CHRISTENSEN et al. Nature 2000;404:455
