Report of the Honorary Secretary to the 79th annual meeting of MSSVD held at the Royal Society of Medicine, Friday 27 October 2000

My final year as Honorary Secretary to MSSVD is now drawing to a close. The final challenge I set myself is to have circulated a summary of the main activities of the society including accounts and financial report in advance of the annual general meeting. It has required the hard work of the officers of the society, the secretariat and finance department at the RSM, and Graham Tomlinson, charitable governance adviser. The annual report was printed in November and circulated to members.

There are now 657 UK members of the society, with 101 overseas members and 31 honorary life members, 21 of whom are resident in the United Kingdom. There were 62 new members last year, of which 34 were nurses and health advisers. There are a number of MSSVD members to whom we paid tribute. These included Dr Ratnatunga; Dr George Csonka; Dr Christine Bakshi; Dr T Reed; Dr Andrew Crooks. January 21 was a particularly sad occasion for the society when Maggie Godley sadly died following her two year illness. She will be remembered for all the work she put into running both MSSVD and AGUM and for her care and support as a fellow human being. Her husband has agreed to a memorial, which will be in the form of a prize given to the best presentation from a district general hospital consultant at MSSVD Spring meetings.

The past year has seen an even more rapid pace of change resulting in the Honorary Secretary having difficulty keeping her head above water. Some major issues for the society have been identified.

The first of these is a review and implementation of the changes to the charitable governance of MSSVD. As incoming treasurers, Simon Barton investigated the duties and role of the Honorary Treasurer and after discussion with the officers, it was agreed that expert assistance would be required to undertake a comprehensive review of the society's position. Mr Graham Tomlinson was appointed as an external consultant to support the officers, resulting in the clarification of the roles and responsibilities of the officers, council, and trustees of the charity. Clearer mechanisms for decision making, strategy, and development of business plans are in place for the future. The charitable governance will continue to be a priority for the next two years with his support. The Honorary Secretary and treasurer together with Mr Tomlinson have been developing an appropriate contract with the RSM to provide infrastructure and support services for the running of the society and refinement of the membership database. The contract will include a specification for secretarial and financial services, lines of accountability, an arrangement with the society for housing and lending of the MSSVD library books, and support for educational activities.

Educational initiatives

The Education Sub-Committee met on five occasions. Following discussion at the Education Sub-Committee, it was agreed that in 2000–1, one of the ordinary general meetings format would be altered to take into account adult learning theory; the meeting will be in March 2001 and run by the HPV Special Interest Group. The “Induction training steering group” has achieved its objective of producing an educational package suitable for non-consultant career grade doctors starting in the specialty and this will be launched at the start of this academic year. A skills course “Teaching the teachers” has been developed by the education officer Dr Jonathan Cartledge and education coordinator Sarah Chippendale, which will take place in November. Dr Jonathan Cartledge has completed his term of office as education officer and relinquished his post in December 2000. Sarah Chippendale was coopted from her post as academic health adviser at Mortimer Market Centre and returned to her full time post in December 2000. On behalf of MSSVD members, I would like to thank them for challenging the education subcommittee with new ideas and engendering a critical look at our education and meeting programme. The future of further educational initiatives and support structures required to deliver these will be a priority for this coming year.

The website has become an integral part of delivery of education to members of MSSVD. The OGM meetings are now summarised and reported on the website. This initiative will be developed in the future as information technology at the RSM changes. There may be an opportunity to provide more webcasting similar to that used at the MSSVD Spring meeting, in Baltimore.

CME/CPD

A major change for doctors over the next 2 years will be the introduction of validation. The royal colleges have been working together with the GMC to coordinate the requirements for validation. The Royal College of Physicians has formalised a CME/CPD community forum for meetings between CME regional representatives and specialist societies. CME/CPD requirements will change and some assessment measures will be introduced. All doctors will be required to undertake CME/CPD and this will have substantial effects on clinics employing NCCG colleagues. MSSVD as a specialist society will be devising appropriate CME for its members in liaison with the RCP.

Meetings

Five ordinary general meetings were held in the Barnes Hall at the Royal Society of Medicine. The topics highlighted important advances in diagnosis and management. There were key strategic issues for the specialty raised particularly in relation to medicolegal aspects and the needs of adolescents. The “Doctors in training” presentation meeting, which gives opportunity for presenting practice presentation skills, showed that our trainees continued to perform to a high standard. The prize was awarded to Dr Nelson David, for his presentation on “Zoon’s limits.”

MSSVD was host society for the Federation of Infection Society meeting held in Manchester on 1–3 December 1999. This is the first time that the meeting has coincided with the World AIDS Day. The meeting was very successful with the highest number of registrants recorded. Consequently, the VAT bill is larger than usual and the term “success” was confined to educational and social rather than financial! The debate trio of Drs Simon Barton, Colm O’Mahony, and Do- lores Hooker provided eye opening entertainment for our more reserved colleagues in other infection disciplines.

MSSVD continues to provide meetings in conjunction with other societies. These have included the SSSTD/ASTDI meeting held in London, South City, and the joint BHIVA/MSSVD held on 8 October 1999. The MSSVD/ASTDA inaugural meeting was a resounding success. The society has been asked by the Section of Dermatology at the RSM to develop a joint meeting, which will take place on 8 June 2001.

NCCG meeting

The MSSVD NCCG meeting organised by Dr Jonathan Ross took place in September and was well received.

**MSSVD National Continuing Professional Development course in GU Medicine/HIV/AIDS**

This year the MSSVD took over the running of this course, previously known as BPMF, latterly the CPD course run by University College, London. The steering group is chaired by Dr Jackie Sherrard. This is a new and challenging venture for the society. The aim will be to offer a reduced price for MSSVD members on courses arranged by MSSVD. There has also been discussion about the need for a more basic course directed at primary care physicians, healthcare workers working in contraceptive services, and others providing sexual health services to complement the DFFP run by the Faculty of Family Planning and Reproductive Health Care (FFPRHC). Over the next year a core curriculum will be developed and the course piloted. The intention is to deliver this on a regional basis.

**Special interest groups**

The six special interest groups have submitted business plans to the treasurer for their educational activities for 2000–1. A proposal for a further special interest group of “Adolescent sexual health” has been accepted by council and will be submitting a business plan.

**Doctors in training meeting**

Last year the meeting was held in the president’s home city of Sheffield. Although the standard of hotels fell short of expectations, the scientific programme was well received and the skill workshops of personal image and communication skills provided direction to the consultants of tomorrow. The local cabaret of Karen Rogstad, David Daniels, Mary Stevenson, and Stephen Green, infectious disease consultant at Sheffield, entertained us on Saturday evening. Pfizer kindly sponsored the event.

**MSSVD undergraduate prize**

This was awarded as follows: clinical prize to Dr Daniel Jary, “Why do young people still catch STIs?”

**Other MSSVD activities**

The changes in provision of medical care driven by government have made a significant impact on the day to day activities of all healthcare workers. Key issues that have been discussed at council have included charitable
The Sexual Health and HIV Strategy due to report in early 2001 may have a significant impact on services providing sexual health care. The challenge for our specialty is to be at the forefront of these changes, being part of the broader picture and outward looking into the communities which we serve, in contrast to a more passive approach of waiting for the “at-risk” population to come to us. This requires a critical look at the way services are provided at present and opportunities for providing them in a more efficient way. Our strengths, particularly with regard to health promotion, partner notification, accessibility and skills in communicating with young people, need to be increased and marketed. We are fortunate to have at the helm of MSSVD an extremely proactive president with strategic vision and a grip on operational aspects of running sexual health services. I am delighted that the work which has been undertaken over the 4 years since I have been Honorary Secretary will continue, be refined, and changed according to political imperatives and the needs of people accessing our services. I wish Keith Radcliffe as my successor good fortune and thank him and the treasurer and president for all the help and encouragement that they have proffered over the last year.

Finally, my thanks to all fellows and members for their continuing support to the MSSVD and to me personally over these past 4 years.

ANGELA J ROBINSON
Honorary Secretary

LETTERS TO THE EDITOR

Papulonecrotic tuberculide of the glans penis

EDITOR,—A 27 year old promiscuous, married man presented with recurrent episodes of ulceration of the penis of 12 years’ duration. Each episode began with a painful small raised lesion which got ulcerated and finally healed spontaneously in 2–3 months. The present episode of painful ulceration had been lasting for 6 months or so. In spite of various treatments received from various private practitioners, his genital sore did not respond.

On physical examination, this moderately nourished individual had a single well defined ulcer on the glans penis near the urethral meatus, measuring 8 × 5 mm. The edge of the ulcer was undermined and its floor had necrotic slough. The ulcer had perforated deeply into the urethra, resulting in dribbling of urine through it (fig 1). Multiple puckered scars over the glans penis circumferentially, just distal to the coronal sulcus, were evidence of previous episodes of similar ulcerations. The inguinal lymph nodes were not significantly enlarged. His systemic examination was unremarkable.

The haemogram revealed a raised erythrocyte sedimentation rate (64 mm in the first hour). The Mantoux test was strongly positive (20 × 20 mm). VDRL and HIV serology were non-reactive. Radiological investigations did not demonstrate any focus of tuberculosis in the chest or genitourinary system. Smear and culture of discharge from the ulcer and also of urine for acid fast bacilli were negative. Histopathological examination of the ulcer (glans penis) revealed ulcerated epidermis. In the deep dermis, by the side of the ulceration, there were caseating tuberculous granulomas along with perivascular inflammatory infiltrate with vessel wall thickening and endothelial cells swelling. Fite’s stain for acid fast bacilli was negative.

Even though it is considered to be rare, tuberculide of the penis was a manifest as primary, secondary, or papulonecrotic tuberculide type. Clinically, it may present as superficial ulcers of the penis or tuberculous cavernositis. Papulonecrotic tuberculide, a form of cutaneous tuberculosis, represents an allergic reaction to bursts of antigens reaching highly immune skin following haematogenous spread from an internal focus. The tuberculide is often not clinically active at the time of eruption as seen in our case. The diagnosis of papulonecrotic tuberculide in our case was based on the well laid down criteria.

Papulonecrotic tuberculides are mostly extragenital, but rarely genitalia may be involved. Sometimes, the glans penis alone may be involved in our patient and then diagnosis becomes difficult. Under these circumstances, it needs to be differentiated from atypical soft sore, syphilis, recurrent herpes simplex, and malignant ulcer. The diagnosis of such cases rests on biopsy, tuberculin testing and, in doubtful cases, a therapeutic test is usually decisive. The possibility of tuberculide as a cause of chronic ulcer on the penis has to be kept in mind especially in countries like India, where tuberculosis is still prevalent.

Table 1 Mean total and subscale scores for Attitudes to Lesbian and Gay Men (ATLQ) Questionnaire

*ATG = Attitudes to Gay Men. ATLG = Attitudes to Lesbian Men.
results are presented in table 1. The majority of the sample displayed positive attitudes to lesbians and homosexual men with female students exhibiting statistically more positive views especially in relation to homosexual men. However, a significant minority of men (11.8%) exhibited extremely negative attitudes to homosexual men.

We are encouraged by these results which are contrary to much of the published data on attitudes among physicians, nurses, and medical and non-medical students. However, we must continue to challenge negative attitudes as studies show that teaching and promoting tolerance can result in change. Otherwise difficulties with disclosure in medical settings will continue to impact on provision of health care to WSW and homosexual men and further hamper research in this area.

Questionnaires and postal research: more than just high response rates

EDITOR,—In the recent editorial by Bates and Rogstad the authors describe the problems associated with conducting postal research including response rates, use of incentives, bias, mailing clinical specimens, and ethical issues. We would like to add that there are many problems associated with postal research. There can be many problems. Ka

diaritis and lichen sclerosus (fig 1) a biopsy was performed. Histology was reported as showing poorly differentiated invasive squamous cell carcinoma with vulval dystrophy but no features of wart virus infection. She was promptly referred to the gynaecological oncology department where local radiotherapy and chemotherapy were the initial treatments of choice as the tumour extended close to the anal margin. The immediate response was encouraging but subsequently vaginal adhesions and difficulty with micturition developed. A pelvic CT scan showed bilateral inguinal node involvement (fig 2). Radical block dissection was subsequently performed but lymphoedema and local skin nodules developed and she died 2 years after diagnosis.

Figure 1 Appearance of the vulva—ulceration remains despite therapy for HSV. Note white plaques, small haemorrhages, and labial resorption typical of lichen sclerosus.
EDITOR,—Those who have spent some time sexually shared infections
human papillomavirus (HPV) types. STDs other than HPV are also associated with an increase in the risk of developing vulval neoplasia. The presence of antibodies to HSV type 2 has been implicated as a risk for cervical pathology but a role for HSV in vulval neoplasia is unclear. Vulval basal cell carcinoma presenting as culture negative genital herpes has been reported. In our case the carcinoma was culture positive for HSV; this may have been due to new infection or to reactivation of pre-existing HSV in the presence of malignancy. This case highlights the need for biopsy of herpetic lesions which fail to respond to standard therapy.

Sexually shared infections

EDITOR,—Those who have spent some time in genitourinary medicine will surely agree that the speciality has gone through vast changes over the years. Not only the nomenclature of our clinics from VD clinics or specialist clinics to psychosocial health departments but also the name of our speciality itself has undergone a metamorphosis.

I was therefore interested to note the term “sexually shared infections” suggested by Hopwood et al and wondered what message it would project to our patients, sorry our “clients.” Hence, I decided to test this new term in my clinic and would like to share the results with the readers of STI.

Firstly, I saw a young girl who had primary presentation of genital warts. I suggested that she might have “shared” this infection with her partner to which she replied, “Look doctor, I know HE gave it to me because he is the one who was sleeping around.”

The next one was a young man who presented with acute gonorrhoea. When I said he might have shared this infection with the one night stand he had in Manchester he replied, “Look doctor, I am no fool. I was so drunk that night that I couldn’t perform but she went away ahead any way then this happened.”

The third one was a chlamydia re-infection. The young girl was found to be positive and received a single dose regimen. Her boyfriend was referred to a GUM clinic but by the time he attended they had had protected sex but the condom split and the girl was reinfected. When I mentioned the “shared” element she fumed, “It was him who gave me this in the first place and he wouldn’t get treatment himself because he felt OK.”

English is not my first language but I always thought that you “share” something that is nice. Like sharing the tender moments, sharing your good fortune, sharing when it floated on stock market, etc.

Sharing an STI to me sounds a bit awkward.

In my opinion people transmit the infections knowingly or unknowingly because of their high risk sexual behaviour. It does not matter if we try to play this down and make it acceptable. There always will be some stigma attached to STIs but we should ensure awareness, patient education, and partner notification. I believe this should be done by professionals in a confidential setting in a genitourinary medicine clinic. Changing the terminology about the mode of transmission will not eliminate the stigma attached to STIs but the more open we are about infections the better it will be for our patients.

Deterioration of disseminated cutaneous Mycobacterium avium complex infection with a leukaemoid reaction following institution of highly active antiretroviral therapy

EDITOR,—The impact of highly active antiretroviral therapy (HAART) on the incidence of opportunistic infections (OI) in HIV infected patients has been well documented. HAART also frequently alters the clinical course of OI. Increasingly, immune reconstitution disease is recognised after starting HAART in patients with latent or established OI.1,2 Despite the marked reduction in incidence of disease due to Mycobacterium avium complex (MAC) in the HIV infected population over the past 5 years, this OI is often implicated in immune reconstitution disease and may be difficult to treat.3,4 Focal mycobacterial lymphadenitis appears to be the commonest manifestation,5 but other organs may be involved.

A 40 year old white HIV positive man presented with Staphylococcus aureus tricuspid valve endocarditis; blood cultures also grew MAC. He had a history of cutaneous Kaposi’s sarcoma and oesophageal candidiasis. After inpatient treatment of the endocarditis he defaulted from outpatient follow up. Five months later he re-presented with a 3 month history of fever, cough, malaise, and painless skin lesions on both arms and legs. Examination showed multiple dermal papules and nodules. A skin biopsy has been performed on the right shin. (B) Five days after re-presentation. Medial aspect of left ankle. There are two erythematous lesions, which were tender to touch. Both have a putteral centre.

Endoanan, The impact of highly active antiretroviral therapy (HAART) on the incidence of opportunistic infections (OI) in HIV infected patients has been well documented. HAART also frequently alters the clinical course of OI. Increasingly, immune reconstitution disease is recognised after starting HAART in patients with latent or established OI.1,2 Despite the marked reduction in incidence of disease due to Mycobacterium avium complex (MAC) in the HIV infected population over the past 5 years, this OI is often implicated in immune reconstitution disease and may be difficult to treat.3,4 Focal mycobacterial lymphadenitis appears to be the commonest manifestation,5 but other organs may be involved.

A 40 year old white HIV positive man presented with Staphylococcus aureus tricuspid valve endocarditis; blood cultures also grew MAC. He had a history of cutaneous Kaposi’s sarcoma and oesophageal candidiasis. After inpatient treatment of the endocarditis he defaulted from outpatient follow up. Five months later he re-presented with a 3 month history of fever, cough, malaise, and painless skin lesions on both arms and legs. Examination showed multiple dermal papules and nodules with necrosis and some scarring (fig 1A). The CD4 count was 10 cells × 10^9/l and the HIV viral load 202 300 copies/ml. Skin biopsy revealed multiple poorly formed granulomata; numerous acid fast bacilli (AFB) were seen and MAC was subsequently cultured from skin, sputum, urine, and blood. He was treated with rifabutin, clarithromycin, ethambutol, and isoniazid; treatment was reduced to clarithromycin and ethambutol alone, after 6 weeks when the mycobacterium was specified. HAART,
A notifiable disease of the 21st century, Chlamydia trachomatis is a cause of urogenital chlamydial infection and one of the four major sexually transmitted infections (STIs). The detection of genital chlamydial infection has been identified as a priority and research carried out through the C trachomatis Clinical Research Network has shown that prompt screening and diagnosis is associated with improved health outcomes, increased awareness of the disease and a reduction in STIs.

Among the most significant findings was the demonstration that early diagnosis and treatment of Chlamydia trachomatis infection could decrease the risk of pelvic inflammatory disease (PID), leading to reduced risk of infertility in women.

This study compared the effectiveness of different diagnostic methods and found that nucleic acid amplification tests (NAATs) were more sensitive than conventional methods such as the Darkfield examination. The use of NAATs was also associated with a higher rate of diagnosis and treatment, reducing the risk of complications such as PID.

In conclusion, early diagnosis and prompt treatment of Chlamydia trachomatis infection are critical in reducing the risk of PID and preventing long-term complications. The implementation of NAATs in clinical practice has significantly improved the detection rate of chlamydial infection, leading to better health outcomes for affected individuals.
physician whose clinical practice, research ideas, and papers didn’t always make a lot of sense.

I grieve for their loss but I am grateful that I worked for these two great venerologists.

BOOK REVIEWS

This is a follow up on the author's 1976 Report on Female Sexuality. It confirms the findings of her earlier report on American women and includes a "postscript" which reports similar findings in UK, Australian, and New Zealand women. The emphasis is on orgasm frequency.

In the American part of the study three versions of a questionnaire (labelled I, II, and III) augment the earlier 1972-6 study (labelled IV). Altogether, the number of questionnaires distributed was 100 000 with 3019 returned. The number of questionnaires I, II, and III returned was 1844. Replies received from UK, Australian, and New Zealand women to questionnaire IV numbered 511. The author claims that, especially, questionnaires I, II, and III give a true representation of women of all ages and occupations. The figures are presented partly in the text and by detailed appendices. The text provides detailed individual quotes in abundance on all aspects of female sexuality and orgasm.

In brief, there is little new to report. Masturbation remains the surest source of orgasm for both single and multiple. Orgasm "rarely" occurs during intercourse without additional stimulation. Most women were willing to accept sex with a man even if she did not experience an orgasm with him. Lesbianism was a regular source of orgasm for a few women but many more would "like to try" such a relationship.

From the answers to questions and the personal views presented by women, it is clear that the majority support Hite's view that a "sexual revolution" is needed. They see the way forward as through greater openness. There is a need to destroy double standards—for example, the contempt that society has for women, in contrast with men, are not respectable. In addition, it is clear women would like it noted that they would appreciate the pattern and definition of sex to include greater sexuality. Sexual intercourse on its own is not enough for many. Greater diversity is called for. In other words women's desires and needs, not least in achieving orgasm more regularly, need to be taken into account.

By way of summary, Hite calls for greater dissemination of data regarding the anatomical basis and the physiology of female orgasm with emphasis on the role of the clitoris. In her revolutionary terms she sees orgasm as a metaphor for women's power in society.

The findings confirm those of Freud, Kinsey et al as well as Masters and Johnson and make it clear that men not only need to take the clitoris seriously but to ensure that its function is more regularly fulfilled whatever the form of sexual congress.

R S MORTON

Over the years, many books on the use of antimicrobials in the treatment of infectious disease have been written. Although few of these books have a subtitle implying that resistance will be specifically dealt with (as with this book), most of them by necessity write about this topic. I approached this book with a degree of cynicism, expecting to find the same tales retold in the same formulaic way. The first part of the book was not what I expected and I was pleasantly surprised. The first seven chapters dealt with the science of resistance generally and then with specific examples, in a way that was informative and relevant to many clinicians. These early chapters also information on epidemiology, public health measures, and vaccination that are relevant to managing the problems of resistant organisms. Although this is a multi-author book, there seemed to be more consistency in approach and writing in these early chapters than those found later. The latter part of the book was little more than the systems based summary of antimicrobial use found in so many books.

As is to be expected with a book written by American authors, there are differences in practice from that in the United Kingdom: recommendations for treatment of community acquired pneumonia differ from those of the British Thoracic Society; recommendations for the treatment of infective endocarditis differ from those of the ESPAC Working Party. Although generic drugs, some of these are different (although comparable) from those we would use in the United Kingdom. The authors frequently recommend the use of trimethoprim-sulfamethoxazole; because of the risk of sulphonamide toxicity, the CSM only recommends the use of this combination for specific indications in the United Kingdom. In the chapter on meningitis the authors do not recommend the immediate use of penicillin and ciprofloxacin in clinical suspicion (UK guidance). The controversy of use of antibiotics in the treatment of infective diarrhoea is not discussed. Most importantly, the adverse effects of using antibiotics in shigellosis in children and EHEC infection are not mentioned.

The chapters on the treatment of sexually transmitted infections and HIV are short for a specialist reader, and there really should have been a separate chapter on hepatitis. I doubt there is much in this book that the established GUM clinician or scientist will find helpful. The trainee GUM physician may be confused or misled.

MSSVD Course in STIs and HIV, Spring 2001, to be held at the Institute for Materials, 1 Carlton House Terrace, London, UK

This modular course runs twice a year and is aimed predominantly at SpRs, NCCGs, and practitioners from overseas. It leads to the diploma in genitourinary medicine of the Society of Apothecaries but participants can complete the course without taking the examination. The course aims to provide participants with an overview of current practice in GUM, sexual health, STIs, and HIV infection and related areas, focusing particularly on practice in the UK, but within the context of the worldwide epidemic of STIs.
