Background As part of an on-going STI microbiological surveillance programme, we investigated associations between Chlamydia trachomatis infection and the demographic, clinical, microbiological and behavioural characteristics of patients presenting with either male urethral discharge syndrome (MUDS) or vaginal discharge syndrome (VDS) to a public healthcare facility in Johannesburg, South Africa.

Methods 1,218 MUDS and 1,232 VDS cases were consecutively recruited during 6 annual surveys, starting in 2007. Genital discharge pathogens were detected using a molecular assay for N. gonorrhoeae, Chlamydia trachomatis, Trichomonas vaginalis, Mycoplasma genitalium and by microscopy of vaginal smears (bacterial vaginosis, Candida). Serology was used to detect syphilis, HSV-2 and HIV infections. Chi-squared tests and logistic regression analyses were used to identify predictors of C. trachomatis infection.

Results Overall, 286 (23.5%) men and 197 (16.0%) women were C. trachomatis positive, with the highest prevalence observed in men (30.5%) and women (25.9%) aged 20–24 years. In the multivariate analysis, C. trachomatis was less likely to be detected in MUDS patients co-infected with N. gonorrhoeae (aOR 0.36, 95% CI, 0.26–0.49) and HSV-2 (aOR 0.70, 95% CI, 0.51–0.95) as well as patients who had received antibiotics recently (aOR 0.43, 95% CI, 0.20–0.91). In contrast, the likelihood of C. trachomatis infection was higher in VDS patients co-infected with either N. gonorrhoeae (aOR 2.22, 95% CI, 1.48–3.32) or M. genitalium (aOR 2.24, 95% CI, 1.45–3.47) infection but lower in women who were older (aOR 0.68, 95% CI 0.40–0.97) or who had Candida morphotypes detected (aOR 0.66, 95% CI 0.44–0.98).

Conclusion The increased likelihood of co-existent gonococcal or M. genitalium infections, but the decreased likelihood of Candida infection, in women with VDS-associated chlamydial infection suggests that these women are at higher risk of STIs, and potentially HIV. Paradoxically, gonococcal infection as well as recent antibiotic use, reduced the likelihood of MUDS patients having chlamydial infection.

P3.293 CONDYDAV: PROSPECTIVE OBSERVATIONAL STUDY OF PATIENTS WITH EXTERNAL GENITAL WARTS(EGWS) CONSULTING IN STI CLINICS IN FRANCE

J Chanal, 1S Fouéré, 1Yassine Oria, 1N Spenatto, 1F Bouscarat, 1F Picot, 1O Aynaud, 1M Janier, 1N Dupin, the group MST-Sida from the French Society of Dermatology, 1Department of Dermatology, pavillon Tarnier, Hôpital Cochin, APHP Paris, France; 2STI centre, Hôpital Saint Louis, Paris, France; 3CIDDOST, Hôpital de la Croix Rousse, Lyon; France; 4STI centre, Hôpital de la Grave, Toulouse, France; 5CIDDOST, Hôpital Bichat, Paris, France; 6Department of Dermatology, Hôpital Saint Eloi, Montpellier, France

In this prospective, observational study, we analysed clinical features and treatments between January 1, 2011 and March, 31 2011 of patients consulting for EGWs in 15 STI clinics through France. 372 males and 111 women were included; mean age 31.2 years old. Women were younger than men (31.7 and 28.9 y.o respectively p < 0.05). 414 (85.7%) were heterosexuals, 13 bisexuals and 54 (11.2%) homosexuals; mean age at first sexual intercourse: 17 y.o. Males reported more sex partners in the last 12 months (more than 3 partners in 32.6% versus 11.9% p < 0.01). In males, 250 had an involvement of the penis alone and 46 had an involvement of the anus alone. 76 patients had EGWs of the anus, among them 26 were MSM. In females, 76 had an infection of the vulva alone and 22 a co-infection vulva and anus. Concerning cervical cancer screening, 13 had never been tested (mean age 24.8 y.o. [17–40]); mean delay for the last screening: 12 months [1–108]. Three women have been vaccinated against HPV. 3 males were newly diagnosed HIV positives and 8 for syphilis (7 were MSM RR: 50). In females, 2 patients were HIV positives and 13% had an infection by Chlamydia trachomatis (11/84 not known: 27). Women were significantly more treated with Imiquimod (53% Vs 19.9% p < 0.001).

P3.294 ASSOCIATION OF MYCOPLASMA GENITALIUM WITH CERVICITIS IN NORTH INDIAN WOMEN ATTENDING GYNECOLOGIC CLINICS

S Sethi, 1S Rajikumari, 1L Dhaiwal, 1A Roy. 1Dept of Microbiology, Post Graduate Institute of Medical Education and Research, Chandigarh, India; 2PGIMER, Chandigarh, India; 3Dept of Obstetrics and Gynecology,PGIMER, Chandigarh, India

Background The aetiology of mucopurulent cervicitis is not known in 50% of cases and cannot be attributed to the known cervical pathogens Neisseria gonorrhoeae, Chlamydia trachomatis, Genital Mycoplasmas are such organisms which can be easily overlooked as there is a lack of sufficient laboratory infrastructure for diagnosing them in developing countries. Also, there is the lack of awareness among physicians about M. genitalium infection. There is scarce literature showing the association of M. genitalium with cervicitis and no reports from India. The purpose of this study was hence to...
