UNDERSTANDING THE GREATER BURDEN OF STIs among Black Caribbeans in the UK: EVIDENCE FROM A SYSTEMATIC REVIEW

Sonali Wayal*, 1Catherine Griffiths, 1Catherine Mercer, 1Makeda Gerressu, 2Gwenda Hughes. 1University College London, London, UK; 2Public Health England, London, UK

Background In the UK, Black Caribbeans are disproportionately affected by STIs.

Aim We conducted a systematic review of attitudinal, behavioural and contextual risk factors of this inequality.

Methods Ten electronic databases were searched for studies on risk factors and drivers of STI among UK Black Caribbeans from 1948 to 30/11/2014. Two independent reviewers screened all identified abstracts and extracted data from selected studies using standardised forms.

Results Of 3220 abstracts identified, 165 were included in the review. STI risk among Black Caribbeans is higher compared to other ethnic groups and varies by gender and age. Being single and reporting first intercourse aged <16, >1 new sex partner in the past year, concurrency, and assortative sexual mixing were identified as risk factors. STIs were considered of lower priority than HIV/unplanned pregnancy. Barriers to condom use, especially among women with older and regular partners, were reported. Compared to other ethnic groups, Black Caribbeans were more likely to have ever attended a STI clinic and tested for HIV, but Black Caribbean women were more likely to report delays in seeking care and be sexually active whilst asymptomatic. Perceived negative attitudes of clinic staff of the same ethnicity towards young women negatively affected care-seeking.

Discussion/conclusion Sexual behavioural risk factors or access to care did not fully explain the disproportionate STIs burden among Black Caribbeans highlighting the need for further evidence on contextual drivers of STIs. STI reduction interventions should be gender-specific, informed by partnership patterns and address attitudes to STIs and sexual health care-seeking.

Background/Introduction Homeless people are at increased risk of STIs, and may struggle to attend conventional services. To improve sexual health access and knowledge for this group, THT launched a weekly outreach testing project for asymptomatic clients in June 2014 at the local homeless service. HIV point of care tests (POCT) and self-taken STI screens (SHS) were offered. Hepatitis B/C POCTs were introduced more recently.

Aim(s)/Objectives To assess the value of the outreach service and describe project outcomes.

Methods User demographics and testing outcomes were collected at each attendance and reviewed at 6 months.

Results From June to December 2014, 129 clients presented. 83% were white British, 92% were male. The mean age was 36 (range 19–65 years). 84% identified as heterosexual, 14% bisexual and 2% homosexual. Only 26% had previously tested for HIV. Of the asymptomatic service users, 45% had a HIV test (all negative) and 23% had a self-taken SHS. Two cases were positive; one urethral chlamydia, one rectal gonorrhoea. Eighteen referrals were made to the local SH clinic for symptomatic screens, blood-borne virus (BBV) testing, vaccination and contraception. Since introducing hepatitis POCTs 2 weeks ago, 4 clients have tested and 2 were positive for hepatitis C.

Discussion/conclusion Prior to project launch, this client group had significant anxiety regarding HIV and BBV. Having the ability to access a full SH screen in familiar surroundings was welcomed. A significant number of infections have been identified demonstrating the importance of the outreach project, and the need for strong links with mainstream services.

Reach Out and Test Me

Susanna Currie*, 1Melissa Pearson, 2Holly Eadsworth, 1Ofna McQuillan. 1Manchester Royal Infirmary, Manchester, UK; 2University of Manchester, Manchester, UK

Background Saunas have traditionally been where MSM participate in risky sexual activities, contracting high numbers of sexually transmitted infections (STIs) and have been ideal targets for sexual health outreach work. There has however been a recent trend towards private “Chem-Sex” parties arranged through social media. Is sexual health outreach work in the saunas still justified, particularly in these financially pressured times?

Aim Comparison of outreach services in a large urban centre in 2011 and 2013.
