Discussion/conclusion Unscheduled bleeding is the most common reason for premature removal of implants, however many reported multiple reasons. All removals except one required ongoing reliable contraception, but none were willing to reinset implant. These clients require support to continue this very effective form of contraception: future support includes: Identify who may require monitoring; Stress choices at outset; Offer bleeding management at early stage; Follow up new insertions at 6/52 via telephone support from Health Advisor or Nurse. Ongoing work will include monitoring and surveys on post TOP removals.

P247 QUALITY OF LIFE AND SEXUAL FUNCTION AMONGST WOMEN WITH PERSISTENT GENITAL DISCHARGE OR DERMATOSES

1Nina Vora*, 2Gary Whitlock, 3Nataliya Brima, 4Angela Robinson. 1Mortimer Market Centre, London, UK; 2University College London, London, UK; 352 Dean Street Clinic, London, UK

Background Existing data on the effect of genital discharge and dermatoses on the quality of life (QoL) and sexual function (SF) in women with genital complaints are limited.

Objectives To study the impact of our specialist clinic for recurrent genital problems on QoL and SF using two validated questionnaires: dermatology life quality index (DLQI) and female sexual function index (FSFI).

Methods All women attending this specialist clinic during 2013 were invited to complete both DLQI and FSFI. Questionnaires were resent six months later or completed at follow-up attendance. Paired questionnaires were analysed using Wilcoxon-signed-rank tests.

Results We received 143 responses: 99 dermatological complaints and 44 discharge complaints. Both complaints have a detrimental effect on QoL (mean ± SD quality of life scores 8.4 ± 6.6, moderate effect on QoL vs published general population score between 0 and 1 in validation studies). SF was also impaired (score 19.6 ± 6.9, vs published general population mean score 30.5 ± 5.29). 13 patients fully completed DLQI pre and post clinic intervention; there was significant improvement in DLQI scores (median pre-intervention vs post-intervention scores, interquartile range (IQR]): 15 (12–18) vs 8 (6–12), P = 0.013). FSFI scores did not significantly improve (18.55 (16.5–22.5) vs 18.5 (14.0–22.7), P = 1.000).

Discussion/conclusion Both QoL and SF are impaired in many women presenting with recurrent genital complaints. Appropriate assessment and management by senior physicians can significantly improve QoL in these women supporting the role of specialist clinics. There remains significant impairment to SF, warranting research into affordable interventions.

P248 SENSITIVITY OF THE AMSEL’S CRITERIA COMPARED TO THE NUGENT SCORE IN ABSENCE AND IN PRESENCE OF TRICHOMONAS VAGINALIS (TV) AND/OR CANDIDA SPP AMONG WOMEN WITH SYMPTOMATIC VAGINITIS/ VAGINOSIS

1Lucile Belley-Montfort, 2Joel Lebed, 3Bonnie Smith, 4Melissa Farrel, 4Jane Schwebke, 5Paul Nyrijev, 6Thomas Davis, 7DeAnna Fuller, 8Kenneth Fife, 9Safedin Sojo Beqaj. 2BD Diagnostics, Québec, QC, Canada; 3Planned Parenthood Southeastern Pennsylvania, Philadelphia, PA, USA; 4Planned Parenthood Gulf Coast, Houston, TX, USA; 5The University of Alabama at Birmingham, Birmingham, AL, USA; 6Drexel University, Philadelphia, PA, USA; 7Pathology Inc, Torrance, CA, USA; 8352 Dean Street Clinic, London, UK; 9Vanderbilt University, Nashville, TN, USA

Background/introduction In a multicenter clinical trial funded by BD, we observed less accurate clinician diagnosis of bacterial vaginosis (BV) based on clinical observations when Trichomonas vaginalis (TV) and/or Candida spp. were also detected by the trial Reference Methods than when only BV was detected.

Aim(s)/objectives To determine the sensitivity of each criterion and of the overall Amsel’s criteria (3/4 criteria met), the results of the Amsel’s corresponding to the sub-population of specimens that gave a Nugent score of 7–10 were analysed.

Methods Following informed consent, women with symptoms of vaginitis/vaginosis were included in the trial. The four Amsel’s criteria and the Nugent score were performed. Evaluation for trichomoniases by wet mount and culture (InPouch™, TV, Biomed) were performed. Candida colonies were isolated (BBL™ Sabouraud Dextrose Agar, Emmons and BBL™ CHROMAgar™ Candida plate, BD) and identified by ITS-2 bi-directional sequencing (Accugenix®).

Results In total, 269/497 (54.1%) specimens gave a Nugent score of 7–10. Amongst them, TV and/or Candida spp. were found in 100 specimens (37.2%). The sensitivity of clue cells, amine test, vaginal pH, BV vaginal discharge, and overall Amsel’s criteria in absence of TV and/or Candida spp. was 86.3%, 82.7%, 91.1%, 71.0%, and 84.6% respectively. In presence of TV and/or Candida spp., the sensitivity was 63.6%, 64.0%, 75.0%, 42.0%, and 60.0% respectively (p values ≤ 0.0009 for all comparisons).

Discussion/conclusion The sensitivity of the Amsel’s criteria in women with BV decreases when TV and/or Candida spp. are present. The BV vaginal discharge is the least sensitive criterion.
