Introduction Peer dialogues influence the adoption of behavioural changes to reduce the risk of HIV infection (human immunodeficiency virus). By intervening experimentally in the community to change risk behaviour patterns, it may be possible to promote widespread reductions in HIV risk practices within a population.

Methods The intervention identified and trained young age range 18–26 people who are reliably identified as leaders among one of these key populations - gay men and MSM, transgender people (transvestites and transsexual women), drug users and harm reducers and sex workers - in all five regions of Brazil to act as multipliers of behavioural changes for their peers, in relation to HIV. We also include young people living with HIV, considering that it is important that these young people share the experience of living with HIV with other young people in greater vulnerability and risk.

Results 140 young people from the key populations were trained in the 5 Brazilian regions. The proportions of the key populations trained in this intervention were 41.9 per cent homosexuals and MSM, 14.5 per cent harm reduction or drug users, 8 per cent transgender people, 6 per cent sex workers and 15 per cent young people living with HIV. Approximately 70% of young trained in this intervention have already developed some activity to multiply the information about prevention and behavioural practices to reduce HIV infection in their respective territories and communities, promoting knowledge about combination prevention and changes related to sexual practices and behaviours.

Conclusion Interventions that empower young to endorse change can produce or accelerate changes in the behaviour and sexual practices of the young population to reduce the risk of HIV infection. These interventions have a network of multipliers in a successive chain of HIV information and combination prevention to reduce HIV infection and risk behaviours through peer-to-peer communication at the community level among young key populations in Brazil.

EVALUATING THE COSTS, BENEFITS AND COST-EFFECTIVENESS OF MULTI-PATHOGEN POINT-OF-CARE TESTS FOR SEXUALLY TRANSMITTED INFECTIONS IN SYMPTOMATIC GENITOURINARY MEDICINE CLINIC ATTENDEES

Introduction Sexually Transmitted Infections are widespread, and have effects on the reproductive and sexual health of the general population particularly youths and adolescents. The study was done to assess the level of knowledge, perception and attitudes towards STI’s by undergraduate students. The objective was to understand and describe the drivers of sexual behaviour amongst university undergraduates and gain an insight into their perception of sexually transmitted infections.

Methods This was a cross-sectional study. A structured self-administered questionnaire on risk factors for STI’s was given to respondents to answer. The study was conducted in October 2016.

Results The mean age of the students (n=310) was 17.8 years +/-1.77 SD.: males were 0.39 times more likely to be sexually active than females [p = <0.001, X²=15.0, CI=0.23–0.69], females were 2.18 times more likely to join an abstinence club [p = 0.005, X²=7.6, CI=1.24–3.81]. Males were 0.3 times more likely to believe condoms protect against all STI’s [p = <0.001, X²=10.93, CI=0.14–0.63] and were 2.61 times
