used to determine the risk of acquiring HIV infection at 18 months among the exposed infants.

**Results** A total of 170 exposed infant were recruited and more than two-thirds of the infants were males (74.1%) with median age was 4±2.3 months. One hundred and fifty (88.2%) received infant prophylaxis and 116 (68.2%) had EID done at 6 weeks. Of the 170 exposed infants 19 (11.1%) were positive at 18 months final outcome of which 4 (21.1%) died. Time from being confirmed HIV positive to starting ART was 4.0±2.1 months. COX regression showed that the risk of acquiring HIV infection in females (Adjusted HR = 0.56, 95% CI 0.37–0.87), babies who received infant prophylaxis (Adjusted HR = 0.5, 95% CI 0.1–0.9), infants whose maternal CD4 count < 500 (Adjusted HR = 1.19, 95% CI 0.4–2.6) and time of starting ART > 3 months (Adjusted HR = 3.5, 95% CI 1.8–11.5).

**Conclusion** The risk rate among studied exposed infants was high. Continuous placement of HIV positive mothers and exposed infants on prophylaxis, timely initiation of ART will go a long way in reducing the burden of pediatric HIV.

**P100** **BIDIRECTIONAL ASSOCIATION BETWEEN HUMAN IMMUNODEFICIENCY VIRUS AND PSORIASIS: SYSTEMATIC REVIEW OF COHORT STUDIES**

1 Yi-Yu Chen*, 1 Yu-Hsin Cheng, 1 Tao-Hsin Tung, 1 Kaohsiung Medical University, New Taipei City, Xinhua District, Taiwan; 2 Kaohsiung Medical University, Taipei City, Taiwan; 3 Cheng Hsin General Hospital, Taipei, Taiwan

**Background** Human immunodeficiency viral (HIV) induce production of autoantibodies could attack the person’s immune system. Patients with HIV infection might present with more severe complications of psoriasis, a chronic autoimmune inflammatory skin disease. But there were insufficient evidences prove the risk between HIV and psoriasis.

**Objectives** Systematic review was performed to explore the association between HIV and psoriasis, to provide risk assessment and improve patient outcomes.

**Methods** We used the search strategy: ‘(psoriasis OR psoriatic arthritis) AND (AIDS OR HIV OR acquired immune deficiency syndrome OR human immunodeficiency virus OR CD4 OR CCR5-delta32)’ in searching the Cochrane Library, PubMed and EMBASE electronic databases without language restrictions in May 2018.

**Results** Four cohort study (187954 participants) were included in this review. Studies report the results of the incidences of psoriasis patients with HIV infection. While the total incidence on current data of psoriasis was 0.46%, HIV patients had higher risk than normal for developing newly diagnosed with psoriasis whether receiving substance treatment or not. However, psoriasis patients in general do not appear to have increased infection rates of HIV.

**Conclusion** The available evidence shows that HIV is a potential risk factor for psoriasis. The evidence at the present stage only supports the relationship between HIV infection and psoriasis, but more literature is needed to support such relevance.

**P103** **OPTIMIZATION OF DATA AUDITS TO ACHIEVE EPIDEMIC CONTROL AND QUALITY OF CARE IN KAJIADO CENTRAL SUB-COUNTY**

1 Robert Nyamwaya*, 2 Precious Mtshabazxi, 3 Claire Barake, 1 Fred Avoga, 1 Edna Anab.
1 National AIDS and STI Control Programme, Strategic Information Unit, Kajiado, Kenya; 2 National AIDS and STI Control Programme, Care and Treatment, Nairobi, Kenya; 3 Kajiado County, Department of Health, Kajiado, Kenya

**Background** Every Month, health care providers submit copies of the MOH 731 reports to the SubCounty Health records and information officers. The data is then uploaded into the DHIS and becomes available for consumption by all the relevant stakeholders. Without a regular onsite audit of the data before uploading it, several errors may occur ranging from data entry transcription errors, arithmetic errors to outright inconsistencies with the source documents. Such errors render it unusable and incorrect. In order to correct this, Kajiado Central SubCounty, adopted a timely onsite data review and audit to identify and address the gaps reflected.

**Methods** The SubCounty Health management team receives and reviews the monthly reports by the fifth of every month. Any gaps identified are either corrected instantly with the staff submitting the report or an on-site mentorship report is developed. Upon uploading, the DHIS reports are downloaded and cross-checked with the MoH 731 and the source documents for consistency.

**Results** After a year of instituting such reviews, the data consistency between DHIS, MOH 731 and registers improved from 45% to 90%. The linkage and transitioning to ART for newly identified increased from 44.4% to 90%. Additionally, Maternal and infant prophylaxis improved from 99% and 88% to 97% and 100% respectively for those on PMTCT/ART however due to over reporting on maternal prophylaxis after cleaning there was a decline from 99% to 97%. N/B There is a graph which i was unable to attach here which i communicated same to Yurim Park.

**Conclusion** Regular review of monthly reports at the collection point helps to quickly identify reporting gaps. Consequently, accurate gaps identification led to the correct remedial action on the technical areas and hence improvement on the indicators.

**Disclosure** No significant relationships.
study utilized the theory of planned behavior to explore socio-cultural factors that influence condom use intentions among African migrant youth in South Africa.

Methods Using a qualitative research approach and snow-ball sampling procedures, indepth interviews were conducted with 20 migrant youth from other African countries, aged between 20-25 years and residing In Cape Town, South Africa. Most African migrant youth residing in South Africa have acceptable levels of knowledge about condoms and condom use and linkages to HIV prevention and safer sexual practices. Traditional norms on sexual behaviour prohibit young migrants to freely discuss safer sexual choices. Gendered norms in sexual relationships, acculturation and cultural expectations of referent others reportedly influence intentions to use condom during sexual intercourse.

Conclusion The nexus among socio-cultural norms, acculturation and safer sexual choices are shown to be crucial to any HIV prevention interventions among African migrant youth in South Africa.

P109 PREVALENCE AND FACTORS ASSOCIATED WITH ANY DEPRESSIVE SYMPTOM AMONG HIV-INFECTED ADOLESCENTS IN THE REPUBLIC OF CONGO

1Martin Herbas Ekat*, 2Marcel Yotebieng, 3Valérie Laciny, 4National AIDS Control Program, HIV Care Support Unit, Brazzaville, Congo; 2Ohio State University, Ohio, USA; 3INSERM Toulouse, Toulouse, USA

Abstracts

Background To describe the frequency of any depressive symptom and associated factors among adolescents (10 - 19 years old) living with HIV in Brazzaville and Pointe Noire, Republic of Congo (RoC).

Methods Adolescents aged 10 to 19 years, on antiretroviral treatment, followed in the two Ambulatory Treatment Centers in Brazzaville and Pointe-Noire, RoC were included in this cross-sectional study. Between April 19 and July 9, 2018, face-to-face interviews were conducted with all participants using a standardized questionnaire that include the nine-item of the Patient Health Questionnaire (PHQ-9). Bivariate and multivariable log-binomial model were used to estimate the prevalence ratio (PR) and 95% confidence interval (95%CI) assessing the strength of the association between predictors and presence of depressive symptoms defined as PHQ-9 score ≥ 9.

Results A total of 135 adolescents were interviewed. Overall, 67 (50%) were male, 81(60%) were 15–19 years old. PHQ-9 was ≥9 among 52 (39%) of participants. In bivariate analysis, the proportion of participants with PHQ-9 score ≥9 was higher among participants who learnt about their HIV status after a prolonged illness; those who reported been sexually active, drinking beer, aged 15–19, stopped school, forget to take antiretroviral treatment more than 2 times in the 7 days preceding the interview, having lost both parents, and not having family support in taking ART and attending HIV care. In multivariable analysis, the following factors remained statistically significant: being 15–19 years old (PR:2.07,95% CI:1.06–4.04), having stopped school (PR:1.60,95%CI:1.06–2.42) and reporting instaces of omission to take antiretroviral treatment more than 2 times in the 7 days preceding the interview (PR: 2.06,95%CI:1.23–3.45).

Conclusion The prevalence of depressive symptoms among HIV-positive adolescents is high and is associated with older age, poor compliance, and dropping-out of school. Active screening for depression during routine medical visit and proper management is needed.
