were compared using annualized incidence. The distribution of those flagged as HIV-positive was compared by database.

Results
The best performing case-definition (YI 0.71) was two or more HIV diagnoses in two years in physician claims, or in hospital discharge abstracts; or 14 or more HAART dispensations in two years; or one positive HIV laboratory. Sensitivity, specificity, PPV and NPV was 82.3% (95%CI: 79.1%-85.5%), 86.8% (95%CI: 84.9%-88.7%), 74.1% (95%CI: 70.6%-77.6%), 91.4% (95%CI: 89.8%-93.1%), respectively. Annualized incidence (2009–2015) calculated from this case-definition was 7.4/100,000 persons (95%CI: 6.8–8.1)); annualized incidence calculated from surveillance data was 7.7/100,000 persons (95%CI: 7.1–8.3). Approximately 76% of cases would have been flagged through a positive laboratory; 43% through pharmaceutical claims; 34% through physician claims; and 11% through hospital abstracts. 95% of cases would have been flagged through the combination of laboratory and pharmaceutical databases. Only 4% of cases were flagged in all four data sources.

Conclusion
Although the combination of four databases produced the most complete prevalence snapshot, laboratory data was the most important contributor. The combination of laboratory and pharmaceutical databases would have identified the predominant majority of cases in our sample. Findings can be used to inform the construction of administrative data cohorts where the availability of population-based data sources may be more limited.

BURDEN OF OPHTALMIA NEONATORIUM AMONG BABIES OF PLHIV AT A DISTRICT HOSPITAL IN KUMASI, GHANA

Thomas Agyarko-Poku*, Alex Owusu Ofori, Kwame Buabeng, Yaw Adu Sarkodie, Suntreso Government Hospital, Ghana Health Service, Genitourinary Medicine, Kumasi, Ghana; Kwame Nkrumah University of Science and Technology, Kumasi Ghana; School of Medicine and Dentistry Sciences, College of Health Sciences, Kumasi, Ghana; Kwame Nkrumah University of Science and Technology, Kumasi Ghana; Department of Pharmacy Practice, Faculty of Pharmacy and Pharmaceutical Sciences, College of Health Sciences, Kumasi, Ghana; Kwame Nkrumah University of Science and Technology, Kumasi Ghana

Background Ophthalmia neonatorum, also called neonatal conjunctivitis is a complication of Neisseria gonorrhoeae and Chlamydia trachomatis infections characterized by copious eyes discharge of newborn babies of infected untreated genital women. We examined babies born of women to determine the prevalence of ophthalmia neonatorum.

Methods This descriptive retrospective study reviewed the records of 257 babies aged 3 days to 14 days, of lactating women accessing care at the STI Clinic of the Suntreso Government Hospital in Kumasi Ghana from January to August 2018. Socio demographic characteristics as well as the clinical records and pregnancy details of the babies and mothers respectively were collected. Data was analysed using SPSS version 16.

Results 56 (26.5%) of the 257 babies were from HIV positive mothers who have been on ART for over 2 years. 61.5% (158/257) of the babies had uneventful delivery while 38.5% (99/257) were delivered through caesarean section on account of breach presentation and foetal distress. 47.3% (122/257) of the mothers were symptomatic for vaginal discharge. A total of 211 (82.1%) of the babies were diagnosed and received syndromic treatment for Ophthalmia neonatorum. Of this number 20.4% (43/211)) were babies of HIV positive mothers and represented 76.8% (43/56) of the total number of babies of the HIV positive mothers. The study found a significant association (p, < 0.000) between babies with Ophthalmia neonatorum (98/122) and symptomatic mothers as well as HIV infection (p<0.001).

Conclusion HIV infection is a risk factor for sexually transmitted infections. Ophthalmia neonatorum remains a significant contributor to morbidity among babies born to Persons living with HIV. HIV positive women in the reproductive age group may have to be screened and treated for sexually transmitted infections in order to prevent further transmission to babies.

**PRODUCTIVE IMPACT OF ASSISTED REFERRALS AND INCENTIVIZED ENROLLMENT ON THE UPTAKE OF HIV SERVICES IN LAGOS STATE, NIGERIA**

Felix Iwuala*, Association for Reproductive and Family Health (ARFH), Orphans and Vulnerable Children (OVC) Program, Lagos, Nigeria

10.1136/sextrans-2019-sti.356

**Background** Nigeria has the second highest global prevalence of Human Immunodeficiency Virus (HIV), with over two million children (0–17 years) made vulnerable by HIV, having lost either or both parents to Acquired Immune Deficiency Syndrome (AIDS). The Association for Reproductive and Family Health (ARFH) is implementing a five year Local Partners for Orphans and Vulnerable Children (OVC) Project in Nigeria, with support from the United States Agency for International Development (USAID), to mitigate the impact of HIV/AIDS on children and vulnerable households, in Lagos State. Poverty remains a major driver of HIV in Nigeria.

**Methods** Strategies include HIV Risk Assessments, Assisted Referrals and incentivized enrollment. The Community Volunteers (CVs) accompany those referred for HIV Testing Services (HTS) to health facilities, results are collected and HIV positives are counselled and linked to treatment same day. Incentivized enrollment on treatment is for indigent enrollees, to promote retention. The sum of $25 is provided in three equal instalments as coupons, redeemed on producing evidence of enrollment on treatment, and two subsequent drug refills.

**Results** All the 43,495 enrollees (males: 16,908, females: 26,587) know their HIV status. The data subsets include 31,396 OVC (males: 15,482, females: 15,914) and 12,099 caregivers (males: 1,426, females: 10,673). Increased yield of persons living with HIV was recorded. A total of 3,418 enrollees (males: 865, females: 2,553) tested HIV positive and have been linked to treatment. The subsets of HIV positive enrollees include 753 OVC (males: 170, females: 583) and 2,665 caregivers (males: 487, females: 2,178).

**Conclusion** Implementation of ‘Assisted Referrals’ and ‘Incentivized Enrollment’ on treatment, will increase access to HTS, linkage and retention on treatment and adherence for viral suppression, thereby contributing to UNAIDS 95–95–95 Goal. Absolute achievement was recorded on this project, with all the 43,495 enrollees knowing their HIV status and 3,418 that tested positive placed on treatment.

**ALINITY M HIV-1 ASSAY: DESIGN AND PERFORMANCE**

Jeffrey Wutschick*, Anna Sobol, John Karavits, John Saltzuro, Hemalata Joshi, Mark Sasaki, Tomasz Krupinski, Shihai Huang. Abbott Molecular, Research and Development, Des Plaines, USA

10.1136/sextrans-2019-sti.357

**Background** HIV is characterized by a high degree of genetic diversity, presenting a challenge for the development of assays for initial diagnosis and subsequent monitoring of therapy response. Alinity m HIV-1 was developed on the Alinity m System, a fully automated, random/continuous access analyzer, to achieve accurate quantitation across groups, subtypes and circulating recombinant forms (CRF), concurrent HIV-1 confirmation and viral load monitoring in plasma, confirmation in serum.

**Methods** Abbott’s Global Surveillance program was utilized to identify the most conserved target regions across HIV-1 variants. The assay targets two HIV-1 genomic regions and utilizes partially double-stranded probes, RNA-specific sample preparation chemistry, unit-dose lyophilized amplification reagents, and patented ReadiFlex™ sample processing logistics to deliver a time-to-first-result of 115 minutes. The Alinity m HIV-1 assay was evaluated for key performance attributes.

**Results** Alinity m HIV-1 demonstrated linearity from 10 to 20,000,000 Copies/mL and demonstrated a within-laboratory SD of ≤0.13 Log Copies/mL from 2.3 to 7.4 Log Copies/mL. Probit analysis demonstrated that the assay detected HIV-1 RNA with 95% probability at 13.88 Copies/mL using 3rd WHO HIV-1 Standard (subtype B). The assay exhibited ≥95% detection for HIV-1 group M subtypes, groups O and N at 20 Copies/mL. Correlation between Alinity m HIV-1 and Abbott RealTime HIV-1 assays demonstrated a mean bias of -0.03 Log Copies/mL (95% CI: -0.05 to 0.00). Confirmatory method agreement between Alinity m HIV-1 assay and comparator HIV-1 assay was 100%.

**Conclusion** The Alinity m HIV-1 assay utilizes a state of the art instrument system and dual-target assay design to deliver highly sensitive detection of diverse HIV-1 groups/subtypes and accurate quantitation across a wide dynamic range while facilitating rapid turnaround time (115 minutes) and workflow flexibility. By providing confirmation and baseline viral load measurement in one test, the assay reduces the number of steps required for initial diagnosis of infection.

**REPRODUCTIVE OUTCOME AND FETAL GROWTH IN HIV-INFECTED PREGNANT WOMEN AT A UNIVERSITY HOSPITAL IN VITÓRIA, BRAZIL**

1Helena Lucia Barroso Helena Reis, 2Vinicius Barros, 3Ana Fernanda Rangel, 4Daniel Ribeiro Da Rocha, 5Paulo Roberto Meireles Vargas, 6Angélica Miranda*. 6Federal University of Espirito Santo, Vitória, Brazil; 1Helena Lucia Barroso Helena Reis, Vitória, Brazil; 6Federal University of Espirito Santo, Vitória, Brazil; 6Federal University of Espirito Santo, Pathology, Vitória, Brazil; 6Universidade Federal do Espirito Santo, Departamento de Medicina Social, Vitória, Brazil

10.1136/sextrans-2019-sti.358

**Background** The infection by the human immunodeficiency virus (HIV), as well as the acquired immune deficiency syndrome (Aids), a worldwide epidemic, may lead to serious consequences in terms of maternal and fetal morbidity and mortality. The objective of this study was to describe the reproductive outcome and fetal growth in HIV-infected pregnant women and verify its relation to the antiretroviral use and severity of HIV infection.

**Methods** Cross-sectional study, with 122 pregnant women infected by HIV who had their termination in a university hospital maternity in Vitória, state of Espirito Santo, Brazil, from November 2001 to November 2014. The data was extracted from medical and public records in regard to gestational age, HIV status, antiretroviral use, and fetal dimensions.
