

**P285 FACTORS ASSOCIATED WITH MOTHER-TO-CHILD HIV TRANSMISSION IN WESTERN NIGERIA: IMPORTANCE OF 90–90–90 GOALS IN THE ELIMINATION**

Saeed Usman*, Prosper Okonkwo, Olusotayo Jolayemi, Jay Osi-Samuels, Patrick Akande, Babatunde Ladi-Akinjemi, Olumeni Olatan, Femi Owolagba, Matthias Alagi, Eke Ofuche. APIN Public Health Initiatives, Abuja, Nigeria

10.1136/sextrans-2019-sti.408

Background HIV pandemic has continued to be a huge challenge in Nigeria, with the problem of stigmatization reducing the chances of early determination of the HIV status of pregnant women. Hypotheses tested were the influence of maternal antiretroviral therapy (ART) use and infant’s feeding option on baby’s final early infant diagnosis (EID) outcome. The study was aimed at evaluating the associated variables with mother-to-child transmission of HIV & the factors associated with the transmission of the infection from the mothers.

Methods This study was a prospective cohort study of HIV-exposed infants conducted in Western Nigeria, between January 2015 and September 2017. Dried Blood Spots (DBS) were analysed using polymerase chain reaction technique. All data collected using Epidata and were statistically analysed, using statistical package for the social sciences (SPSS).

Results A total of 197 pregnancies resulting in 200 live births, 91 (45.5%) female and 109 (54.5%) male exposed to HIV were recruited. The overall MTCT rate was found to be 1.5% after cessation of all exposures, with two of these babies given mixed-feeding and their mothers not taking antiretroviral therapy during pregnancy. The factors associated with MTCT in the univariate analysis include HIV diagnosis late during pregnancy, virological suppression & late ART commencement. Maternal antiretroviral therapy (ART) use & infant feeding option were found to have significant effect on baby early infant diagnosis (EID) outcome ($\chi^2 = 15.40, df = 2, P = 0.001$; $\chi^2 = 12.67, df = 2, P = 0.001$).

Conclusion The diagnosis of HIV and antiretroviral therapy coverage prior to pregnancy are the main factors in the prevention and elimination of mother-to-child transmission of HIV, thus, the achievement of the 90–90–90 goals in HIV-infected women would make it possible to achieve the goal of eliminating perinatal HIV transmission in Nigeria.

**P288 SEXUALLY TRANSMITTED INFECTIONS AMONG PREGNANT WOMEN IN RURAL MYSORE, INDIA**

1Sandra Kiplagat*, 2Makella Cou Draj, 3Karl Krupp, 4Kavitha Ravi, 4Poornima Jayakrishna, 1Vijaya Srinivas, 2Purnima Madhivanan, 1Sandra Kiplagat*, 2Makella Cou Draj, 3Karl Krupp, 4Kavitha Ravi, 4Poornima Jayakrishna, 1Carolyne Mati*, 2Catherine Ngugi, 3Rose Wafala, 4Bob Agwata, 5Kigen Bartilol. 1Kenyatta University, 2University of Nairobi, 3Kenya Medical Research Institute, 4University of Nairobi, 5University of Nairobi

10.1136/sextrans-2019-sti.409

Background Sexually Transmitted Infections (STIs) including HIV are a major public health problem in India. Syndromic management is the standard of care for STIs, therefore, there are no studies showing the current screening rates for STIs among pregnant women in India. This study examined the burden of STIs among rural pregnant women in Mysore, India.

Methods Between 2009 and 2014, a prospective cohort study was conducted among pregnant women. All women underwent an informed consent process before answering an interviewer-administered questionnaire in the local language of Kannada. The women consented to providing blood and vaginal samples for testing. All participants received routine antenatal care services and were followed-up immediately after delivery, and at 6- and 12-months after delivery. Descriptive, chi square and logistic regression analyses were computed using SPSS 23.

Results The mean age of the 1,772 pregnant women were 21.1±3.2 years, 98.8% were Hindu, with 36.4% belonging to low-income households. The seroprevalence of HIV and Hepatitis B Virus was 0.4% (95%CI: 0.1–0.7) and 0.8% (95% CI:0.5–1.3) respectively. There were no cases of Syphilis. The burden of BV was 7.4% (Nugent Score: 7–10) and 11.6% for intermediate flora (Nugent score: 4–6). Approximately 8.5% had any one of the infections (HIV, HBV or BV). STIs were significantly associated with sex under the influence of alcohol (Odds Ratio[OR]: 1.59, 95%CI: 1.02–2.48) and younger age of sexual initiation (OR:0.90, 95%CI: 0.83–0.99). Nearly 36.7% of the infants had low birth weight (<2.5 kg) and 5.6% infants died before 28 days. No significant association was observed with STIs and low birth weight and infant deaths.

Conclusion The burden of being diagnosed with any STIs was relatively high at 8.5% and is associated with risky sexual practices which could inadvertently cause adverse birth outcomes. Therefore, there is an increased need for screening and active intervention targeted to rural pregnant women in India.

**P289 SYphilIS TESTING AT ANC IN KENYA: DUAL TESTING AS A GAME CHANGER TOWARDS EMtCT**

1Carolyne Mati*, 2Catherine Ngugi, 3Rose Wafala, 4Bob Agwata, 5Kigen Bartilol. 1Kenyatta University, 2University of Nairobi, 3Kenya Medical Research Institute, 4University of Nairobi, 5University of Nairobi

10.1136/sextrans-2019-sti.410

Background The ANC guidelines advocate every woman in the ANC to get tested of both HIV and Syphilis in Kenya. Despite these recommendations, the level of coverage of Syphilis testing has been low, as a result, women are not tested for Syphilis as required. The ANC guidelines advocate every woman in the ANC to get tested of both HIV and Syphilis in Kenya. Despite these recommendations, the level of coverage of Syphilis testing has been low, as a result, women are not tested for Syphilis as required.
Methods The operational research was a retrospective analysis of reported data from October to December 2016, 2017 and 2018. The data used was sourced from DHIS2. Upon assessment of completeness tabulation was done, and summary statistics obtained.

Results A total of 289,875 women who visited 1st ANC in October to December 2016, 277,196 (95.6%) were tested for HIV and 12,161 (4.3%) tested HIV positive, the proportion that was screened for syphilis was 211,546 (72.9%) women and out of those, 2,396 (1.1%) women tested positive for syphilis. In October to December 2017, a total of 336,512 women visited ANC, 306,573 (91.1%) women tested for HIV and 15,056 (4.9%) turned positive while 262,567 (78%) were tested for syphilis and 3,072 (1.2%) turned positive. In 2018 same quarter, 336,687 women visited ANC, 298,598 (88.9%) were tested for HIV, 16,5805 (6%) turned positive while 307,842 (91%) tested for syphilis and 3,464 (1.1%) tested positive of syphilis. Thus, for the first time ever in Kenya syphilis testing has caught up with HIV testing at 1st ANC. This is an improvement to 91% from 73% which is critical for achievements of the country’s eMTCT targets.

Conclusion Syphilis not only results in intrauterine fetal demise, but also facilitates HIV acquisition and impedes progress towards eMTCT. Kenya’s commitment to reduce MTCT of HIV and Syphilis to below 5% by 2019 requires our country to improve Syphilis screening/testing. To increase syphilis testing, the use of dual testing kits at ANC should be used widely and every woman at ANC should be encouraged and educated on the importance of syphilis test.

P291 IMPACT OF PMTCT SERVICE UPTAKE ON OUTCOME OF CARE AMONG WOMEN ATTENDING ANTI NATAL CARE IN NIGERIA

Background Nigeria has the second largest global burden of HIV/AIDS and also contributes the largest proportion of new vertically acquired HIV infections among children. Despite the effort to control the HIV/AIDS epidemic, elimination of mother to child transmission remains a huge challenge. The study aimed to assess the effect of outcome of care on utilization of prevention of mother to child transmission (PMTCT) services.

Methods A multi-stage cross-sectional study was conducted in 11 states in Nigeria. A systematic random sampling was used to select 365 clients (women living with HIV) receiving PMTCT services in primary and secondary health facilities. Information on PMTCT and outcome of care were extracted using structured questionnaire while descriptive and bivariate data were analyzed using SPSS version 21.

Results Majorly (84.6%) of the clients received HIV counseling and testing at ANC clinics while 40.2% were counselled in a group and 26.7% counselled individually. A high proportion (93.8%) of clients were aware of the early infant diagnostic care services being offered while 92.2% were aware of Navirapin drugs being provided daily for 6 weeks at the health facilities. Similarly, majority (90.0%) of the clients were aware that family planning services are provided in the health facilities while 93.8% had access to infant feeding counselling at ANC. There was no significant difference between outcome of care and utilization of PMTCT services. However, majority of clients who utilized PMTCT services had improved outcome of care.

Conclusion Increased uptake of PMTCT services at ANC contributed to improved outcome of care of pregnant living with HIV and their children. Effort should be made to ensure more women attend ANC to achieve elimination of mother to child transmission in Nigeria.
