better sexual health outcomes. There is a need for strategies to raise uptake of such edu-dramas, and to evaluate whether wider coverage leads to population impact.

P410 PROGRAM EVALUATION TO PROVIDE HIV AND STI INFORMATION IN JUNIOR HIGH SCHOOLS IN KPANDO, GHANA

Danielle Vos, 1Kafui Bavor, 1Edem Richard Adjordor*, 2Laura Koster. 1HardHaven Children’s Home, Kpando, Ghana; 2UNITED Projects, Kpando, Netherlands

Background We are a group of young people, aged 15 to 23 in Junior and Senior High School who are living with HIV. We are starting the conversation in our community to educate youth about HIV and STI. We do this together with our sister organization UNITED. UNITED conducts regular health education about HIV and STI in 13 schools. As ‘The STARS’ we conduct activities on World AIDS Days (WAD) in 19 schools. To evaluate the impact of our activities a program evaluation took place in June 2018.

Methods The program evaluation was a survey to assess students’ knowledge about health behaviors. This survey was conducted in 4 schools that did not have the UNITED health lessons and 3 schools that did have UNITED health lesson and were also part of the WAD activities. The tool used was a modified version of validated Knowledge Attitude Practices (KAP) survey.

Results 382 JHS students participated in this study, aged between 10 and 24 years old, with a mean age of 14.6 years old. 195 attended form 1 and 185 attended form 2. On safe sex, STIs and teenage pregnancy, the intervention group scored 1.5% higher in comparison with the control group. The intervention group scored 0.4% lower on the topic HIV/AIDS than the control group. Both results were not significant.

Conclusion While the results from the process evaluation of STI education show that the 2017 activities did not have the desired effect of increasing knowledge about STIs in the students which took part in the WAD activities in 2017 we are using the findings of the study to better integrate UNITED’s in school education with the WAD to create synergies for learning which we hope will increase the effectiveness of the two activities. We will conduct another evaluation of knowledge secondary school student’s in 2019.

P412 AN EXPLORATORY ANALYSIS OF ASSOCIATIONS BETWEEN PSYCHO-SOCIAL FACTORS AND SYSTEMIC INFLAMMATION AMONG SOUTH AFRICAN YOUTH

Ashley Henry*, 1Daniel Muema, 1Ngomu Akilimali, 1Fatima Laher, 1Marjetha Jaggemath, 1Stefanie Horncsch, 1Patricia Smith, 1Laura Cotton, 1Mags. Bekinska, 1Jenni Smit, 1Janan Dietrich, 1Glenda Gray, 1Mark Brockman, 1Angelica Kaida, 1Thomiz Ndung’U, 1Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada; 2Africa Health Research Institute, HIV Pathogenesis Programme, Durban, South Africa; 3Perinatal HIV Research Unit (PHRU), Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa; 4University of the Witwatersrand, Maternal Adolescent and Child Health Research Unit, Durban, South Africa; 5University of the Witwatersrand, Department of Gynecology and Obstetrics, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa; 6University of the KwaZulu Natal, HIV Pathogenesis Programme and Africa Health Research Institute, Durban, South Africa

Background Psycho-social factors affect biological processes, including inflammation and immune response, yet their contribution to gender and socio-economic disparity of HIV is not well understood. In South Africa, 38% of new HIV infections occur in 15–24 year olds, with 3-times higher incidence among females. In this exploratory study, we examined associations between psycho-social factors and biomarkers of inflammation that may be linked to HIV acquisition in South African youth.

Methods Baseline plasma and linked cross-sectional survey data were obtained from the AYAZAZI study, which enrolled 425 HIV uninfected or HIV status-unknown youth (16–24 years old) who were recruited for a smartphone app with phone-based MI coaching by trained community health coaches (one female, one male).

Results Fourteen (of 26) predominantly black and Hispanic men, ages 16–19 years, who participated in the pilot study were interviewed about their experience. They participated in app activities and coaching that addressed sexual health or fitness (comparison group). Interviews were transcribed and coded using thematic analysis.

Conclusion Phone app-based MI with community health coaches has great potential for use with young men for a variety of health issues including sexual health; however, it has unique obstacles. Phone accessibility may restrict young men’s ability to fully engage and perceptions of a coach’s expertise should be regularly clarified.
