Background Associations between online sex seeking and increased risk for STDs and HIV among men who have sex with men (MSM) typically rely on convenience samples. We examined the prevalence of internet and mobile app use for finding sex partners among a nationally representative sample of MSM.

Methods We analyzed 2011–2017 data from the National Survey of Family Growth, a nationally representative sample of the civilian, non-institutionalized US population (15–44 years). The analytic sample was comprised of males who reported one or more same-sex partners in the past year. We also assessed associations between online sex-seeking and STD risk, sexual health service use, and condom use.

Results Of 13,320 male respondents, 442 (3.0%) reported sex with a man in the past year, of whom 227 (53.7%) had met a partner online. Between MSM who met partners online and those who did not, we found no differences by age, education, race/ethnicity or socioeconomic status. MSM with online use were more likely to identify as gay (69.5% vs 49.4%, p <0.02). They also reported more sex partners overall (M = 3.1 versus 1.6, p <0.0001), and more insertive (33.1% versus 15.4%, p <0.006) and receptive (46.3% versus 8.5%, p <0.0001) anal sex partners, in the past year. They were also more likely to receive sexual risk assessments (56.0% versus 40.4%, p <0.02), STD testing (57.4% versus 33.1%, p <0.0002) and STD treatment (17.8% versus 8.7%, p <0.02) in the past year. We found no differences in condom use.

Conclusion MSM who report using online sources to find sex partners are more likely than other MSM to report behaviors that increase risk for STD/HIV, but are also more likely to engage in behaviors that may mitigate risk, such as STD testing.

CHEMSEX AMONG MEN WHO HAVE SEX WITH MEN IN A MIXED URBAN-NON-URBAN AREA AND ASSOCIATIONS WITH SEXUALLY TRANSMITTED INFECTIONS

Ymke Evers, Genevieve Van Lier, Christian Hoebe*, Nicole Dukers-Muijrers. Public Health Service South Limburg, Maastricht University Medical Center (MUMC) Sexual Health, Infectious Diseases and Environmental Health, Medical Microbiology, Care and Public Health Research Institute (CAPHRI), Heerlen, Netherlands

Background The intentional use of drugs to have sex – chemsex – among men who have sex with men might contribute to the high STI prevalence in this group. Limited data is available on chemsex outside major cities in Europe. The current study investigated the use of a wide variety of drugs during sex in a mixed urban-non-urban area in the Netherlands and their associations with STI.

Methods At two Dutch STI clinics, 350 MSM were recruited and 250 MSM completed an online questionnaire in 2018. Questionnaire data were linked to clients’ most recent STI laboratory test results. Chemsex was defined as using cocaine, crystal meth, designer drugs, GHB/GBL, ketamine, speed, or XTC/MDMA during sex in the preceding six months. The use of other drugs was also assessed. Determinants (any drug use, chemsex, specific drugs, number of drugs, combining, and frequency) potentially associated with STI were assessed using multivariable logistic regression analyses adjusting for sociodemographic characteristics and sexual history.

Results Chemsex was reported by 35% (95%CI: 29–41) of the 250 participants. XTC/MDMA (27%; 68/250) and GHB/GBL (26%; 64/250) were the most used drugs. STI positivity was 33% (29/87) in MSM engaging in chemsex and 12% (12/163) in MSM not engaging in chemsex (p<0.001). Half of MSM engaging in chemsex (45/87) used three of more different chemsex drugs; STI positivity in this group was 44% (20/45). The only factor independently associated with STI was the use of three or more chemsex drugs (aOR: 4.13, 95% CI:1.77–9.62).

Conclusion This study shows that chemsex is prevalent among MSM visiting the STI clinic outside major cities in the Netherlands, suggesting that health services in both urban and non-urban areas should be aware of and informed on chemsex. MSM who used multiple drugs are at particular risk for STI, indicating a special need for STI prevention and care in this group.
