triennial screening guidelines. All women undertook self-collection and the majority of women reported high perceived acceptability, safety, and accuracy of HPV self-collection. HPV 16/18 positivity was 7.6%, with 40% co-infected with HIV. Overall HIV prevalence was 16.4%, however, over 25% of women had unknown HIV status based on medical chart review.

Conclusion HPV self-collection was highly acceptable as part of community-based integrative reproductive health services. Despite being a traditionally underserved population, and women self-reporting being overdue for screening, over half the women were up to date on cervix screening, albeit regular screening was lacking for many. The findings from this feasibility study will inform future implementation of HPV self-collection to improve and maintain regular cervix screening services in street entrenched women.

COMPREHENSIVE HEALTHCARE INTERVENTION FOR FEMALE SEX WORKERS IN ETHIOPIAN STI CLINICS: EXPERIENCE FROM MEKELLE UNIVERSITY

¹Tesfay Gebrehiwot*, ²Zerihun Abebe, ³Dejen Yemane, ³Solomon Gebremariam, ⁴Loko Bongassie. ¹Mekelle University, School of Public Health, Department of Health Systems, Mekelle, Ethiopia; ²Saint Paulos Millenium Medical College, Addis Ababa, Ethiopia; ³Mekelle University, Mekelle, Ethiopia; ⁴Ethiopian Pharmaceutical Fund Supply Agency, Mekelle, Ethiopia

10.1136/sextrans-2019-sti.764

Background Evidence suggests that the presence of untreated sexually transmitted infections (STIs) increases the chance of HIV transmission during unprotected sex. In the Ethiopian context, many female sex workers live in poor conditions in rented slums and are not typically known or recognised by local authorities, making them unable to access health facilities.

Methods Data were obtained from a register of female sex workers recorded for purpose of service provision at confidential STI clinics in Mekelle and Adigrat, Ethiopia, from May 2010 to August 2015 and from May 2011 to August 2015, respectively. A simple descriptive analysis of services delivered to patients was performed.

Results Among the 6288 patients included in this study, the prevalence of STIs was 23.4%. Of these, 12.9% (814/6288) of patients presented with vaginal discharge, 7.9% (490/6288) with genital ulcers and 2.3% (158/6288) with lower abdominal pain (as per the WHO syndromic approach to STIs). Moreover, 180 cases of genital ulcer were tested for syphilis with the VDRL test; 36 (20%) tested positive for active infection. The HIV prevalence declined from 10% in 2010 to 1.1% in 2015. The frequency of STIs amongst repeat patients was considerably lower than that in new presentations.

Conclusions HIV prevalence declined from 10% in 2010 to 1.1% in 2015. Compared to new cases, the frequency of STIs among repeat clients was extremely low, suggesting that the cumulative effect of peer promotion and preventative sexual health education is effective in reducing the rates of STIs among vulnerable populations. Clinic and workplace geography, hours of clinic operation, confidentiality and peer outreach are important factors in the prevention and control of STI/HIV infection in key sex worker populations. A comprehensive clinic intervention enhances early diagnosis and treatment of STIs and increases the proportion of sex workers accessing HIV treatment services.

ROLE OF MANAGEMENT IN ENHANCING EFFICIENCY OF FEMALE SEX WORKERS HIV PROGRAMS IN NIGERIA

Idoteyin Ezirim*, Francis Agbo. *National Agency for the Control of AIDS, Research, Monitoring and Evaluation, Abuja, Nigeria*

10.1136/sextrans-2019-sti.765

Background HIV is high among female sex workers (FSW). Community-based organizations (CBOs) staff and volunteers, deliver HIV services to FSWs. One overlooked avenue for enhancing efficiency in delivery of services is good personnel management. This study was done to understand challenges faced by CBO staff during service delivery and management practices hindering their output.

Methods Qualitative methods were used in this study. Staffs and volunteers from 9 CBOs in three states, Abuja, Lagos and Nasarawa participated in the study. States were selected using convenience sampling. Journals were distributed to CBO staff to document their daily challenges for 3–6 weeks. After 6 weeks, we collected 23 journals, read entries and conducted 6 non-participant observations and 31 key informant interviews. Information from the completed journals, interviews and observations, were grouped into themes to reveal insights. Using these insights, we conducted brainstorming sessions with CBOs to generate problem-solving ideas. The most relevant ideas were tested in focus groups.

Results The study revealed that CBOs provide HIV services as agreed with donors. They did not solicit and implement feedback from volunteers. Instituting feedback mechanisms will make CBO personnel feel relevant and serve as an avenue for harvesting solutions to challenges in service delivery. The study showed that FSW peer session schedules change constantly and volunteers find it difficult to communicate changes to CBO staff resulting in poor supervision. Poor supervision affects the quality of services volunteers provide. Therefore ensuring communication within CBO personnel, will improve coordination of activities and quality of HIV services delivered. Finally, while CBOs have systems in place to reward performance, these systems were underutilized and not incentivized. If reward systems for best practices are rejuvenated, it will motivate personnel.

Conclusion Good personnel management can enhance FSW HIV programs. Feedback mechanisms, communication and reward systems are tools that will ensure efficient delivery HIV prevention services.

UNINTENDED PREGNANCY AMONG FEMALE SEX WORKERS IN MEKELLE CITY, NORTHERN ETHIOPIA: A CROSS-SECTIONAL STUDY

¹Tesfay Gebrehiwot*, ²Rishan Weldegebriel, ³Mussie Alemayehu. ¹Mekelle University, School of Public Health, Department of Health Systems, Mekelle, Ethiopia; ²Mekelle University, City, Ethiopia; ³Mekelle University, Mekelle, Ethiopia

10.1136/sextrans-2019-sti.766

Background Unintended pregnancy is a significant public health concern in the world. Particularly, female sex workers are exposed to the risk of unintended pregnancy, abortion and

their consequences. This study assessed unintended pregnancy and its associated factors among female sex workers in Northern Ethiopia.

Methods A community based cross-sectional study was conducted among 346 female sex workers at five localities of Mekelle city from March to April, 2014. Sex workers were selected with simple random sampling technique using sampling frame obtained from urban health extension program. Epi-data version 3.1 was used to enter data and analysis was done using SPSS version 20. Bivariate and multivariate logistic regressions were performed to identify factors associated with unintended pregnancy using odds ratio and 95% confidence interval with P-value of 0.05.

Results The magnitude of unintended pregnancy among female sex workers was 28.6%. During this period, 59 women had abortion which represents three-fifths, (59.6%) of those with unintended pregnancy. Female sex workers who had history of abortion formerly had 15.6 (AOR = 15.64 95% CI: [8.03, 30.47]) times higher odds of unintended pregnancy compared to their counterparts. Sex workers who had steady partners had 2.9 (AOR = 2.87, 95% CI: [1.47, 5.61]) times higher odds of have unintended pregnancy than those who hadn't. Drug users had 2.7 (AOR = 2.68, 95% CI: [1.30, 5.52]) times higher odds of unintended pregnancy than those who hadn't use. Sex workers who had longer duration in sex work were 67% less likely to have unintended pregnancy than those with <12 months (AOR = 0.33, 95% CI: [0.11, 0.95]).

Conclusion High level of unintended pregnancy and a range of associated factors were identified among sex workers. Improving utilization of effective pregnancy prevention methods in a consistent manner can avert the existing high level of unintended pregnancy among female sex workers.

TIME TRENDS IN PREVALENCE AND INCIDENCE OF HIV, GONORRHEA AND CHLAMYDIA AMONG FEMALE SEX WORKERS IN BENIN, 2008–2018

¹Michel Alary*, ²Luc Béhanzin, ²Fernand Guédou, ²Ella Goma-Matsétsé, ²Marlène Aza-Gnandji, ³Djimon Marcel Zannou, ¹Souleymane Diabaté, ³Dissou Affolabi, ⁴René Kêkê, ⁴Moussa Bachabi, ³Flore Gangbo. ¹CHU de Quebec – Université Laval, Quebec, Canada; ²Dispensaire IST, Cotonou, Benin; ³Université d'Abomey-Calavi, Cotonou, Benin; ⁴Programme Santé de lutte contre le SIDA, Cotonou, Benin

10.1136/sextrans-2019-sti.767

Background The conduction of 3 cohort studies among professional female sex workers (FSWs), e.g. women whose main source of revenue is sex work, since 2008 in Benin allowed the estimation of time trends in HIV, gonorrhea and chlamydia prevalence and incidence in this key population over the last decade.

Methods The 3 cohort studies were conducted from 09/2008–03/2012, 10/2014–12/2016 and 04/2017–09/2018, respectively. Women were recruited at the Dispensaire IST, a FSW-dedicated clinic, after providing informed consent. Follow-up was quarterly in the first 2 studies and bi-annual in the latest one. FSWs were tested for HIV (rapid test with confirmatory assay according to Benin guidelines), gonorrhea and chlamydia (BD ProbeTec™ CT/NG, Becton Dickinson Inc.) at baseline and at each follow-up for HIV and semi-annually for gonorrhea and chlamydia. Questionnaires were administered.

Results In all studies, median age was 32–33 years and the proportion of women not born in Benin 50–60%. HIV [gonorrhea (chlamydia)] prevalence was 37.1% [4.3% (3.5%)] in 2008 (n=396), 29.1% [9.7% (4.8%)] in 2014 (n=361) and 26.0% [13.8% (7.4%)] in 2017 (n=312). There was a significant downward (upward) trend in HIV (gonorrhea and chlamydia) prevalence: $p < 0.001$ ($p < 0.001$ and $p = 0.03$). Among respectively 319, 299 and 213 women with follow-up, gonorrhea (chlamydia) incidence was 8.9 (2.1), 9.0 (4.6) and 14.8 (5.8) per 100 person-years; $p = 0.07$ ($p = 0.003$). HIV incidence was 1.4, 0.8 and 0.7 per 100 person-years in 2008–12, 2014–16 and 2017–18, respectively ($p = 0.41$).

Conclusion HIV prevalence is decreasing, but still high, whereas HIV incidence is low in this highly mobile key population. This combination of high prevalence and low incidence is likely due to HIV treatment scale-up over the last decade, including the adoption of an HIV “test and treat” strategy since 2016 in Benin. However, the increase in both gonorrhea and chlamydia is worrying and calls for renewed control strategies for these curable infections.

CHARACTERIZING HIV-ASSOCIATED VULNERABILITIES AMONG WOMEN ENGAGED IN TRANSACTIONAL SEX TO DESIGN PROGRAMS IN UKRAINE

¹Daryna Pavlova*, ²Olga Balakireva, ³Eve Cheuk, ⁴Shajy Isac, ³Robert Lorway, ³Michael Pickles, ⁵Paul Sandstrom, ⁶Sharmistha Mishra, ³James Blanchard, ³Marissa Becker. ¹NGO “Ukrainian Institute for Social Research after Oleksandr Yaremenko”, Kyiv, Ukraine; ²Institute for Economics and Forecasting, Ukrainian National Academy of Sciences, Kyiv, Ukraine; ³Center for Global Public Health, Department of Community Health Sciences, University of Manitoba, Winnipeg, Canada; ⁴India Health Action Trust, Bangalore, India; ⁵National HIV and Retrovirology Laboratory, JC Wilt Infectious Diseases Research Centre, Winnipeg, Canada; ⁶Li Ka Shing Knowledge Institute, St. Michael's Hospital, University of Toronto, Toronto, Canada

10.1136/sextrans-2019-sti.768

Background Evidence suggests a range of HIV-associated vulnerabilities associated with the exchange of sex for money or other material goods, but most research and programs in Ukraine focus on formal sex work. We sought to describe the prevalence of HIV and HIV-associated vulnerabilities among adolescent girls and young women engaged in transactional sex outside of formal sex work.

Methods We conducted a cross-sectional bio-behavioral study in Dnipro, Ukraine in 2016 of young women (14–24 years). 469 participants were recruited who reported transactional sex but not sex work, from places where female sex workers solicit clients. Transaction sex was defined as a sexual engagement with the expectation of receiving, gifts or other resources in return, when the price of sex is often not negotiated upfront and is implicitly understood.

Results Mean age of participants was 21.2 years. The mean age among participants at first sex was 16.0 years (range 12–21). At first sex 34% (160) received gifts or money, and 7% (34) reported forced first sex. During the past week, 81% (378) had sex with a regular transactional partner, with whom 35% (132) had condomless sex. In the past month, 29% (137) had sex while inebriated with regular transactional partners, and 64% (299) did not use/remember whether a
