**005 – FEMALE GENITAL INFECTIONS, IMMUNOLOGY AND MICROBIOME**

**Monday, July 15, 2019 4:15 PM – 5:45 PM**

**005.1 LOWER GENITAL TRACT PREDICTORS OF ACUTE ENDOMETRITIS AMONG WOMEN WITH SIGNS AND SYMPTOMS OF PELVIC INFLAMMATORY DISEASE (PID)**

1Sharon Hillier*, 2Leslie Meyn, 3Hilary Avolia, 4Michele Austin, 5Lisa Cosentino, 6Melinda Petrina, 7Toni Danville, 8Harold Wiesenfeld. 9University of Pittsburgh and Magee-Womens Research Institute, Obstetrics, Gynecology and Reproductive Sciences, Pittsburgh, USA; 10Magee-Womens Research Institute, Pittsburgh, USA; 11University of North Carolina, Pediatrics, Chapel Hill, USA; 12University of Pittsburgh, Obstetrics, Gynecology and Reproductive Sciences, Pittsburgh, USA

10.1136/sextrans-2019-sti.128

**Background** PID is diagnosed clinically when women have cervical motion, uterine and/or adnexal tenderness, but many women meeting these clinical criteria have no histological evidence of endometritis on endometrial biopsy. The objective of this study was to evaluate vaginal microbiological predictors of acute endometritis among women with signs and symptoms of PID.

**Methods** The Anaerobes and Clearance of Endometritis (ACE) study enrolled women with symptomatic PID in a clinical trial (NCT01160640) comparing treatment regimens with or without metronidazole. This analysis included 169 women who had evaluable endometrial biopsies; acute endometritis was defined as ≥1 plasma cell per 120X field in the stroma plus ≥5 neutrophils per 400X field in the epithelium. *Chlamydia trachomatis* (CT) and *Neisseria gonorrhoeae* (GC) were detected by Aptima Combo 2 and vaginal swabs were evaluated by quantitative PCR for five species of *Lactobacillus* (crispatus, vaginalis, jensenii, gasseri, iners), three species of *Prevotella* (bivia, timonensis, amnii), *Atopobium vaginae*, *Gardnerella vaginalis* and *Megasphaera* phylotype I.

**Results** Only 31(18%) of 169 women with diagnosed PID had endometrial histology consistent with acute endometritis. By univariate analysis, lower genital tract CT, GC and BV-associated bacteria were each associated with increased endometritis, while *L. crispatus*, *L. jensenii* and *L. vaginalis* were negatively associated (P <0.05 for each). Based on the results of multi-variable regression and factor analyses, a risk score for acute endometritis was developed combining CT (3 points), GC and BV-associated bacteria were each if ≥106 and -4 points if ≥109). A score of 5 or more detected 27 (87%) of 31 cases of endometritis and had a negative predictive value of 96%.

**Conclusion** Among women with symptomatic PID, a simple lower genital tract risk score including CT plus 4 vaginal bacteria was a predictor of acute endometritis.

**Disclosure** No significant relationships.

**005.2 CHARACTERIZING THE IMPACT OF PENILE-VAGINAL SEX ON HIV-SUSCEPTIBLE CD4+ T CELL SUBSETS IN THE FEMALE GENITAL TRACT**

1Avid Mohammadi*, 2Sareh Bagherichimeh, 3Azadeh Fazel, 4Elizabeth Tevlin, 5Wangari Tharao, 6Rupert Kaul. 7University of Toronto, Medicine, Toronto, Canada; 2University of Toronto, Medicine, Toronto, Canada; 3Women’s Health in Women’s Hands Community Health Center, Toronto, Canada; 4University of Toronto, Toronto, Canada

10.1136/sextrans-2019-sti.129

**Background** HIV in women is often acquired across the female genital tract mucosa, and a key parameter determining mucosal HIV susceptibility is the density of HIV-susceptible CD4+ T cells, particularly activated CD4+ T cells and Th17 cells. However, although most HIV transmission occurs during sex, the impact of sex itself on CD4+ T cell subsets is poorly described.

**Methods** STI-free heterosexual couples (N=40) were recruited. Blood, cervicovaginal secretions and a cervical cytobrush were collected from the female partner at baseline; couples then had penile-vaginal sex 48h later, with repeat sampling after 1–2 hr and 72 hr. Couples either had unprotected sex (n=31) or condom-protected sex (n=11); two couples participated twice, once with and once without a condom. Cytobrush-derived CD4+ T cell subsets were assessed by flow cytometry, and paired changes assessed by Wilcoxon signed-rank test.

**Results** The proportion of endocervical Th17 (CCR6+) cells transiently increased 1–2 hr after penile-vaginal sex (median increase = 4.95%; p=0.006), and returned to baseline by 3 days. Endocervical activated (HLA-DR+) CD4+ T cells also increased after 1–2 hr, but these increases persisted for >72 hr (1.63%; p= 0.007 and 4.75%; p≤ 0.0001, respectively).

**Conclusion** Penile-vaginal sex rapidly increased the proportion of cervical Th17 cells and activated CD4+ T cells, thought to be key endocervical CD4+ T cell HIV targets. Future work will assess the impact of sex on genital cytokine levels and the microbiota, and correlate cervical immune changes with semen parameters in the male partner.

**Disclosure** No significant relationships.
