
Results Over 50,000 unique patients were included, with median age 30.5; patients were 48% White, 47% men who have sex with men (MSM), and 7% transwomen. Overall, there were 14.6 patients on PrEP for each incident HIV infection (PrEP:Need). PrEP:Need was 24.5 among White patients, compared to 6.6 among Black patients. PrEP:Need was low for Medicaid/Medicare patients (7.9), transwomen (10.0), and particularly Black transwomen (4.6). Low PrEP:Need ratios were usually driven by low Identification:Need ratios, with large differences: among MSM, 23.2 patients were indicated for PrEP per incident infection compared to 7.2 among transwomen. Uptake, measured by PrEP:Identification ratios, were lowest among patients without insurance and highest among those with private insurance.

Conclusion We found high variation in PrEP:Need ratios across race, gender, and insurance status. This may be due to a poor fit between current PrEP indications and actual HIV incidence in key populations; there may also be gaps in patient-provider communication and documentation of PrEP indications in certain populations. We also found evidence of barriers to uptake, particularly related to insurance status. We will discuss ways to improve PrEP detection and uptake, which attendees can apply to their practice.

O10.2 IMPACT OF HIV-PREP FOR FEMALE SEX WORKERS ON COMMUNITY-WIDE AWARENESS, UPTAKE, AND PERCEPTIONS IN A RURAL-AREA KWAZULU-NATAL

Natsayi Chimbindi, Nondumiso Mthiyane, Thembelile Zuma, Kathy Bailey, Deenan Pillay, Nuala Migrath, Guy Harling, Lorraine Sherr, Isolde Birdthistle, Sian Floyd, Jaco Dreyer, Janet Seeley, Maryam Shahmanesh, Africa Health Research Institute (AHRI), Research, Mtubatuba, South Africa; 2London School of Hygiene and Tropical Medicine, London, UK; 3University College London, Research, London, London, UK; 4University of Southampton, Research, Southampton, UK; 5University College London, London, UK

Background Between 2016–2018 a targeted roll-out of pre-exposure prophylaxis (PrEP) for 15-24-year-old female-sex-workers (FSW) was conducted in a sub-district of rural KwaZulu-Natal, South Africa where antenatal HIV-prevalence is 40%. We use an HIV-prevention cascade framework to understand how implementation impacted the first two steps at a population-level, i.e. demand for, access to and community members’ attitudes towards PrEP.

Methods We conducted participatory community mapping of four purposively sampled communities and enrolled a representative nested cohort of adolescent girls and young women (AGYW) aged 13–22 in 2017–2018. We conducted group discussions (14), key-informant interviews (9), in-depth interviews (94) and participatory observations (4). All interviews were recorded, transcribed and analysed using thematic content analysis.

Results Among n=2184 AGYW in the nested cohort, n=965 reported being sexually active, of whom 13.4% reported transactional-sex and 10.6% sex-for-money (therefore PrEP-eligible). PrEP awareness significantly increased from 2% in 2017 to 9% in 2018 (p<0.001). Among PrEP-eligible AGYW (n=194), 11.3% were aware of, and <1% had used PrEP. Interview respondents were generally unaware of PrEP but imagined it would benefit young people, discordant couples and those with long-distance partners. Condoms were described by young people as undesirable, ‘killing your babies’ or ‘eating sweets in a wrapper’, in contrast to PrEP which ‘…will be in their system’ so not act as a barrier. Teachers and healthcare providers were apprehensive: while acknowledging PrEP’s effectiveness, they worried it would lower personal responsibility for sexual health (e.g., abstinence, condoms). Targeting FSWs was portrayed as further stigmatizing PrEP, already tarnished by association with HIV.

Conclusion The narrow focus of public-sector PrEP contributed to implementation challenges in this high HIV-prevalence setting. PrEP reach was low, even amongst self-identifying eligible FSW. Community-based approaches to PrEP education and provision, including engagement of youth and key stakeholders, may help improve demand for, access to, and optimise the PrEP cascade.

O10.3 HIGH CURABLE STI PREVALENCE AND INCIDENCE AMONG YOUNG AFRICAN WOMEN INITIATING PREP IN HPTN 082

Sinead Delany-Moretive, Nyaradzo Mgodi, Linda-Gail Bekker, Jared Baeten, Subash Pathak, Deborah Donnell, Denis Lenon, Scott Rose, Koleopile Macgamathe, Sheetal Kassim, Storla Muitska, Heather Noble, Adesola Adejeye, Connie Celum, University of the Witwatersrand, Wi Triangle, Johannesburg, South Africa; 2University of Zimbabwe, College of Health Sciences Clinical Trials Unit, Harare, Zimbabwe; 3University of Cape Town, Infectious Diseases, Cape Town, South Africa; 4University of Washington, Medicine, Global Health, Epidemiology, Seattle, USA; 5Fred Hutchinson Cancer Research Centre, Seattle, USA; 6Johns Hopkins University School of Medicine, Department of Pathology, Baltimore, UK; 7FHI 360, 8FHI 360, HIV Prevention Trials Network, Durham, USA; 9The Desmond Tutu HIV Centre, Cape Town, South Africa; 10National Institutes of Allergy and Infectious Diseases, Division of AIDS, Rockville, USA; 11University of Washington, Seattle, USA

Background African women face overlapping HIV and STI risks. PrEP programs among men who have sex with men have seen high STI incidence, but few data from African women taking PrEP are available.

Methods HPTN 082 was conducted in Cape Town, Johannesburg (South Africa) and Harare (Zimbabwe) to evaluate uptake and adherence to daily oral PrEP in young African women. Sexually active HIV-negative women ages 16–25 were enrolled. Enrollment vaginal swabs were tested for gonorrhea (GC) and chlamydia (CT) by nucleic acid amplification, and trichomonas (TV) by rapid test. Syphilis serology was assessed. All women with positive test results received treatment. Repeat testing was conducted at 6 and 12 months.

Results Of the 412 women who initiated PrEP, median age was 21 years, 84% reported a primary sex partner and a median of 4 vaginal sex acts (IQR 2.8) in the prior month; 35% reported that they never or rarely used condoms. At enrollment 29% of women had CT, 8% GC, 7% TV and 2% reactive syphilis serology. STI incidence was 29.6 per 100 person-years (py) for CT (95% CI 24.3, 35.4), 11.8 per 100 py for GC (95% CI 8.7, 15.7), and 7.1 per 100 py for TV
